Anthracite—There is no improvement as yet and a very quiet summer is in prospect. The movement by Lake is the only branch that shows activity. The rail-line trade has fallen off still more of late, so that the Lake loadings did not take care of the surplus and some of the companies have been forced to curtail operations, which is rather unusual for this time of the year.

The city trade is so quiet that the retailers are obliged to turn their teams to other work earlier than usual, which is not easy to do. On the other hand the natural-gas operations in this section are very active. This week a new well came in near here with a flow of 1,000,000 ft. of gas daily. Other wells are going down in the same district and they tell heavily against the anthracite trade.

The Lackawanna and Lehigh Valley docks are very active in loading coal for the Upper Lakes, the total for all companies being 156,500 tons for the week.

TORONTO, CAN.

Demand substantially less than normal and the outlook generally discouraging.

Market conditions are unchanged and trade in all lines continues quiet, the demand being considerably below normal. Enforced economy among working people, owing to unemployment or decreased earnings, has reduced sales of anthracite for domestic uses and manufacturing, except in a few lines is inactive, many consumers buying merely from hand to mouth. Prices for best grades are as follows: Retail anthracite egg, stove and nut $7.50; grate, $7.25; pea, $6; bituminous steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $7.50. Wholesale f.o.b. cars, three-quarter lump, $3.56; screenings, $2.90.

TOLEDO

Light Lake movements. Contract coal not selling well just now. Prices holding close to list on sales made.

The coal market here continues dull, the movement is light and the Lake movement is very slow. Threshing coal is in fair demand and it is believed that railroad contracts will be made within a few months. The opening of the Pittsburgh No. 8 mines will not make much difference in the Toledo situation except that more of that coal will be handled, but it will be at the expense of the West Virginia product. There is no heavy movement of smokeless coal although some of the prepared sizes are difficult to secure. Hocking grades are moving slow. Cambridge and Kentucky coals are in fair demand and list prices are being fairly closely maintained on all lines. There are not many contracts being made.

CLEVELAND

The market is unchanged with fluctuations confined to narrow limits. The Lake trade is slowly improving.

The market is just holding its own. The supply of coal that ordinarily goes to the Lakes and leaves the Cleveland market with a surplus of fine coal is not as large as in other years. There were ample stocks of all kinds of coal, and buyers were able to get practically the same prices on anything they wanted.

No. 8 operators and miners formally signed the contract in Cleveland last week. This officially ended the strike and all No. 8 operators are about ready to ship some coal. So far no No. 8 coal has come into the open market. The larger companies that have Upper Lake dock connections are planning to restock the docks which have not received any No. 8 coal in more than 18 months.

Lake shipments are slightly better than two weeks ago, but some of the shippers are confining themselves to such coal as they are forced to take. The supply of boats exceeds the number of cargoes except small boats. These are not in operation and shippers are not able to move cargoes under 4000 tons as promptly as they would like to.

Quotations for shipments to jobbers are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	.....	.....	.....	.....
Lump, ¾ in.	.....	$2.20@2.25	$2.00	$1.80@1.85	$1.75@1.85
Egg	3.10	.....	.....	.....	.....
Mine run	2.65@2.70	2.10	1.85	1.85@1.90	1.75@1.85
Slack	.....	1.65@1.70	1.60	1.65@1.70	.....

COLUMBUS

Buying for school purposes and the approach of the stocking season cause better demand for domestic grades. Steam business is still slow.

One of the features of the trade during the week was the better feeling in domestics because of school buying. Considerable outside buying is also being done for delivery during the coming month. This has given a certain firmness to domestic grades and causes a better feeling in coal circles generally. Some attention is being given to the stocking season, which is expected to be earlier than usual.

Retail trade is quiet but prices are holding up firm on all grades. Retailers' stocks are not heavy and they must come into the market before the stocking season arrives. Another feature is the demand from rural sections for threshing purposes, which is a noticeable factor in Ohio during June and July.

Steam business is quiet all along the line. Manufacturing is still slow, with the exception of war materials and consequently fuel requisitions are not large. Railroads are taking the normal tonnage for freight movement; practically all of the railroad fuel contracts have now been closed. Contracting for steam tonnage is slow because of cheap coal; contracts are being made at a less rate than prevailed last year.

Lake trade is quiet although a larger tonnage from Ohio mines is going to the Northwest. Chartering of boats is not very active because of the uncertainty of the future. A number of Ohio operators do not expect to do any Lake business until after July 1. Docks at the Upper Lake ports are still congested and the interior movement is slow.

Production in Ohio fields has not been increased with the exception of the Pomeroy Bend district which now reports 50 to 60% of the average. In the Hocking Valley the output has been 35% and the same is true of Jackson and Cambridge fields. In the Crooksville field the output is 30%. The production in most fields is expected to be increased as soon as the stocking season opens in full blast.

There is a better demand and higher prices for the small sizes due to curtailed production.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.65	0.70	0.65
Coarse slack	.55	.60	.55

CINCINNATI

A slight improvement in the steam market. Supplies still in excess of demand, due to progress of the Lake movement of domestic. Contracting is noticeably slow and backward.

Close observers are of the opinion that the industrial situation has improved to some extent and that there has been an increase in steam consumption. Lack of confidence seems to be the principal trouble. Contracting is more backward than for several years, many large consumers refusing to tie themselves up for a supply of coal in spite of a general feeling that the trend of prices from now on will be toward higher levels. Hand-to-mouth purchasing continues the rule although price concessions are not believed to be so general. The domestic market is to some extent affected by the same disinclination of the trade and consumers to buy ahead.

LOUISVILLE

Somewhat better tone to the market generally though retail trade is heavy.

The week has seen a turn for the better in the Kentucky coal market, both as to the industrial and the domestic trade. The stocking movement of the retailers has begun on a more or less extensive scale, which is having the result of increasing the supply of steam coals and reducing their prices, while at the same time the working periods are being extended. The Illinois Central has announced that it will store no coal this summer but increase in its current requirements has been of assistance to western Kentucky.

Prices, f.o.b. mines, range about as follows: Block, $1.40 to $1.85; No. 1 steam run of mine, $1; four-inch, 80 to 85c. and nut and slack, 50 to 65c. The retail situation is said to be most distressing with coal in Louisville cheaper than for many years.

COKE

CONNELLSVILLE

Furnace coke market dragging, with fair activity in foundry coke contracting.

The Connellsville coke market still drags. There is more or less inquiry for furnace coke, but it all seems to be of a desultory character. Foundry coke continues its activity as to contracting, but as it is still more than a month until present contracts expire the buying is of a quiet character, and chiefly by consumers who always take the best grade of coke, of which there is only a limited supply. The four operators making a specialty of the highest grade foundry coke are asking $2.40, but some will close freely for the twelvemonth and others are trying to limit contracts to six months, with only a moderate degree of success. We quote: Furnace coke, prompt, $1.50@1.55; to July 1, $1.60; to Jan. 1, $1.75; foundry coke, prompt, $2@2.40; contract, $2.20@2.40, per net ton at ovens.

The "Courier" reports production at 297,554 tons and shipments at 295,967 tons for the week, showing no material change from the preceding week.

Buffalo—The recent slight stir in coke has not been maintained and the market has settled down again to the old quiet state, with prices still at the bottom, on the basis of $4.15 for best Connellsville foundry and $3.15 for stock coke.

Chicago—The coke market is dull and weak, with no signs of improvement. Very little, if any coke is being sold at present, but some contracts for foundry coke are being discussed. Prices are as follows: Byproduct, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

MIDDLE WESTERN

GENERAL REVIEW

Screenings active at strong prices but domestic sizes flat. Some buying from the Northwest. Anthracite moving slowly.

Prices are generally well maintained considering the lack of demand. Some operators are confronted with the problem of having to meet a normal demand for screenings when practically no orders are being received for the coarse sizes. Retal trade is on a very moderate basis, and it is said that some of the yards are slashing prices to keep their equipment busy. It is hoped that consumers who usually buy during the low-priced periods will begin to lay in their supplies next month. The movement of soft coal via the Lakes is still very slow.

The volume of domestic trade is less than usual at this time of the year. The dealers are probably awaiting what is usually termed the "summer storage season" before stocking. Last year considerable high priced coal was carried through the winter and dealers will be careful to avoid a repetition of this state of affairs.

Contracting is still delayed. A few buyers from the Northwest have appeared to look over the situation, make inquiries and close some contracts for the coming season's supply. There is a tendency on the part of these buyers to make their purchases direct from the operators instead of dealing with jobbers. The consumption of railroad coal has fallen off generally since May 1, and the best informed do not expect an increased consumption until late mid-summer.

CHICAGO

Heavy demand for screenings. Railroads holding off for lower prices. Some activity in contracts on smokeless.

Conditions in the Southern Illinois field have changed but little; screenings are the feature of the trade, and have been soaring around the highest mark of the year. Prices for other sizes are well maintained, although the demand is nil.

The situation in Indiana continues about the same, with the domestic trade dwindling to almost nothing and no improvement anticipated before the middle of June. There is no activity in the steam coals except screenings, although the limited production is holding prices steady. There has been some price cutting in order to move a few shipments of domestic coal to retail yards in Indianapolis.

The railroads are not placing contracts for Springfield coal as fast as anticipated, and are evidently out for lower prices. Screenings are the feature of this district, bringing around 85c. with the prospects of going higher.

The smokeless situation is much stronger, and there is no record of any lump or egg having been offered in the Chicago market during the last week at less than $1.70. The retail yards are reported to have little of this coal on hand, and it is felt that they will soon be ordering heavily. There is quite a little contracting for smokeless coals, some retailers evidently believing that they had better get under cover before it is too late, in view of the export situation.

There is little buying in splint coals, and some spot shipments have been sold at off prices.

The Hocking situation is unchanged from last week, and prices are variable without, however, any spot coal on the market to be sacrificed.

Eastern Kentucky coals are offered at all kinds of prices but little tonnage is being taken.

Anthracite is slow, but no doubt the closing days of this month will find orders largely increased. The retailers are buying very small quantities for current consumption, and have not yet placed their storage orders. Circular prices are being maintained by the independents.

INDIANAPOLIS

Slight improvement in both steam and domestic demand. Situation still generally heavy.

Conditions show little change, week by week and mine operations are down to the summer level though the mine owners seem quite cheerful as to the future. There is a slight improvement in the demand for steam grades and if this keeps up, the industry will eventually be on a normal basis again. May has been much cooler, relatively, than April and even March, and there has been an unexpected call for domestic lump. Screenings are still in first class demand at prices ranging from 80c. to 95c. Conditions do not justify throwing coal on the local market and operators prefer to limit the output of the mines to the current necessities of the trade. The mines are running three to four days a week. Money is plentiful and the crop outlook satisfactory.

ST. LOUIS

Selling combine in the Standard district collapses. Good movement on retail storage orders. Steam business weak.

The break-up in the selling organization for the mines in the Standard district is the feature of the market. Parties to the agreement commenced cutting prices on the excuse that they had coal to move and must meet competition. The independents claim it is a price-cutting war to force them into the arrangement. There is very little domestic coal moving either in the city or country. The steam demand is exceptionally light and prices are weaker. Carterville is held at about 85 to 95c., and Standard 80 to 85c.

Anthracite is doing fairly well; it is not being pushed too hard so the tonnage moving is easy. Smokeless tonnage is slightly better than a year ago, but not in the volume that it formerly moved.

In the retail trade advance storage orders for future delivery are good; present delivery is about the same as 1914, which showed a remarkable falling off from previous years. This would indicate that business conditions are considerably below normal, and that the future is somewhat of an uncertainty to the ultimate consumer.

KANSAS CITY

Business somewhat improved and trade rather better than usual.

The retail business in Kansas City showed a slight improvement during the week, due to the cool rainy weather, but it was hardly great enough to be noticed and did not affect prices in any way. The wholesale business is gradually increasing and the companies report that they are selling all the coal that is coming into this market. Both the retail and the wholesale prices are still down to the low point and most of the operators will leave them there for the summer trade.

PRODUCTION AND TRANSPORTATION STATISTICS

BALTIMORE & OHIO

The following is a statement of coal and coke tonnage moved over this system and affiliated lines during April and the previous two months:

	February		March		April	
	1915	1914	1915	1914	1915	1914

Total 3 months	53,838,041	44,331,711

[1] Includes coal received from connecting lines.

[2] Includes company's coal.

[3] Does not include company's coal hauled free.

Note:—The Southern Railway hauled 250,919 short tons of bituminous coal during March, 1914, and 537,162 short tons during the three months ending March.

PENNSYLVANIA RAILROAD

The following is a statement of shipments over the P. R.R. Co.'s lines east of Pittsburgh and Erie for April of the current year and the four months of 1914 and 1915, in short tons:

	April		Four Months	
	1915	1914	1915	1914
Anthracite	1,126,690	1,050,365	3,607,419	3,705,806
Bituminous	3,358,062	3,437,040	13,203,746	14,967,184
Coke	832,427	910,560	3,136,262	3,593,030
Total	5,317,179	5,397,965	19,947,427	22,266,014

I. C. C. Nos. 5572, 5584, 5651—Campbells Creek Coal Co., Campbells Creek R.R. Co., H. C. Dickinson vs. Ann Arbor R.R.

Upon rehearing; **Held,** That through routes and joint rates should be established for the transportation of coal from points on the line of the Campbell's Creek R.R. to the interstate destinations mentioned in Kanawha & Michigan Ry. tariff I. C. C. No. 31 and supplements thereto, and such joint rates should not exceed the main-line or district rates now applied from points on the lines of the Coal & Coke and the Kanawha & West Virginia railroads to the same destinations.

I. C. C. No. 6415—E. I. Du Pont De Nemours Powder Co. vs. Wabash R.R. Co., Et al.

The Wabash R.R. Co. filed and posted a tariff naming a through rate of 90c. per net ton on bituminous mine-run coal in carloads from Springfield and Riverton, Ill., to Mooar, Iowa, in which the delivering line was not named as a party and had not concurred. Charges were collected on shipments from and to the points named on the basis of the combination of intermediate rates. Reparation awarded against the carrier which issued the tariff, on showing that complainant relied on the through rates published, to its injury.

FOREIGN MARKETS

GREAT BRITAIN

Rearrangement of export business under the new rules. Opening of navigation at Archangel.

May 14—The chief feature of the coal markets throughout the country this week was dullness and lack of all activity on account of foreign business, by reason of the uncertain position created by the new coal-export regulations. It is stated that already a good many lincenses to ship coals to Scandinavia on near dates have been promptly received, though there are reports that some licenses for Sweden have been refused. The news that the port of Archangel, through the special efforts of the icebreakers, has now been opened to navigation marks the commencement of activity from Newcastle district to the White Sea. Trading has already commenced, and several steamers are on their way from this country.—"The Iron and Coal Trade Review."

Exports—British exports for April and the first four months of the past three years were as follows:

	April			Four Months		
To	1913	1914	1915	1913	1914	1915

Note—The figures in the above table do not include Admiralty and certain other shipments.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on page 12.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
475	Rock Island Arsenal	Rock Island	Ill.	200b	675
475	Rock Island Arsenal	Rock Island	Ill.	100c	675

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+**No. 664—Washington, D. C.**—Complete list of bids on this contract (p. 836) are given in the accompanying tables. The B.t.u. value of the coal on which the bid is made is given under each quotation.

CLASS 1—45,000 tons, for power plant, Brooklyn.

CLASS 2—50,000 tons steaming coal, (a) for delivery, f.o.b. lighters at Navy Yard, Brooklyn, (b) for delivery in New York Harbor, in lighters alongside vessels, (c) for delivery in New York Harbor, coal unloaded, stored, and trimmed on following vessels, 1, "Solace," 2, "Gloucester," 3, "Culgoa," 4, "Machias," 5, "Wasp," 6, "Tonopah."

CLASS 3—45,000 tons steaming coal, (a) f.o.b. barges at piers, Philadelphia, (b) f.o.b. lighters alongside at Navy Yard, Philadelphia, (c) f.o.b. cars, Navy Yard, Philadelphia.

CLASS 4—35,000 tons steaming coal, Philadelphia Navy Yard, (a) for delivery f.a.s. wharf, (b) f.o.b. cars.

CLASS 5—7500 tons steaming coal, (a) f.o.b. U. S. naval barges at Baltimore, (d) in supplier's barges, f.a.s. ships or wharf, Annapolis, Md., (e) f.a.s. ships or wharf, to be stored and trimmed on ships or stored ashore at contractor's expense.

CLASS 6—75,000 tons steaming coal, Baltimore, (a) f.o.b. barges at piers, (b) in vessels alongside vessels in harbor, (c) in lighters alongside in river between Sparrows Point and Harbor Limits including discharging and trimming in bunkers, (d) in lighters alongside within Harbor Limits, including discharging and trimming in bunkers.

CLASS 7—7500 tons steaming coal, f.o.b. cars, Washington Navy Yard.

CLASS 8—400,000 tons steaming coal, (a) f.o.b. vessels or barges under chutes at piers, Hampton Roads, (b) f.o.b. vessels under chutes at piers, Philadelphia.

CLASS 9—Item 1, 8000 tons semibituminous coal, f.o.b. cars, Navy Yard Charleston, S. C., item 2, 4000 tons semibituminous coal, (a) f.o.b. lighters alongside U. S. naval vessels in Charleston harbor, (b) delivered to vessels alongside contractor's wharf, Charleston, S. C.

CLASS 10—25,000 tons semibituminous coal, Indian Head Md.

CLASS 11—2500 tons, bituminous coal, Chelsea, Mass.

CLASS 12—1300 tons bituminous coal, Lake Denmark, N. J.

CLASS 13—1500 tons bituminous coal, Naval Experiment Station, Annapolis, Md.

CLASS 14—12,000 tons bituminous coal, Naval Academy Annapolis, Md.

CLASS 15—2500 tons bituminous coal, Naval Medical School, Washington, D. C.

CLASS 16—30,000 tons bituminous coal, Navy Yard, Washington, D. C.

CLASS 17—15,000 tons semibituminous coal, Norfolk, Va., (a) f.o.b. cars in navy yard, (b) f.o.b. barge at water front,

+No. 363—Toledo, Ohio—The letting of this contract (p. 566), which provides for furnishing the Water-Works Department with about 15,000 tons of bituminous and anthracite coal, is still being delayed pending the completion of very exhaustive experiments which are being conducted with different fuels. Address Water-Works Board, Valentine Bldg., Toledo, Ohio.

+No. 508—Philadelphia, Penn.—Bids on this contract (p. 665) will be received until 2 p.m., June 7. No bid of $500 or more will be considered unless accompanied by a certificate to the effect that the provisions of Rule 3 of the Board have been complied with. Address Supt. of Supplies A. F. Hammond, Room 392, City Hall, Philadelphia, Penn.

+No. 574—Cincinnati, Ohio—Bids on this contract (p. 749) were as follows: DISTRICT NO. 1—Reliance Coal & Coke Co., New River mine-run, $2.93; splint lump, $2.64; splint nut, pea and slack, $2.17. Ulland Coal Co., Pocahontas mine-run, $2.81; splint lump, $2.68; splint nut, pea and slack, $2.20. DISTRICT NO. 2—Ulland Coal Co., Pocahontas mine-run, $2.90; Reliance Coal & Coke Co., Pocahontas mine-run, $2.93; splint lump, $2.73; splint nut, pea and slack, $2.17. DISTRICT NO. 3—Reliance Coal & Coke Co., Pocahontas mine-run, $3.07; splint lump, $3.23. J. M. Mueller, Pocahontas mine-run, $2.94; splint lump, $3.25. J. J. Weis, Pocahontas mine-run, $2.92; splint lump, $3.50. DISTRICT NO. 4—Reliance Coal & Coke Co., Pocahontas mine-run, $2.97; splint lump, $3.17. Hyde Park Supply Co., Pocahontas mine-run, $2.94; splint lump, $3. Address Business Mgr. C. W. Handman, Bd. of Edu., Cincinnati, Ohio.

+No. 665—Watseka, Ill.—We are advised that the trustees have not yet taken up the matter of letting this contract (p. 836), which provides for furnishing the fuel requirements of the Hospital during the ensuing year. It has not been decided when the matter will come up for consideration. Address Pres. of the Bd. A. F. Goodyear, Iroquois Hospital, Watseka, Ill.

+No. 673—Buffalo, N. Y.—The call for bids on this contract (p. 836), which provides for furnishing the requirements of the City Poor Department, was responded to by only two bidders, the Buffalo Fuel Co. and C. & A. M. Kaiser. The lowest figure was submitted by the latter, being $5.62 for April delivery, but all the bids submitted were on a sliding scale arrangement. Address Overseer of Poor Louis Kengott, Buffalo, N. Y.

+No. 679—Dayton, Ohio—Bids on this contract (p. 876), which provides for furnishing about 6000 tons of coal to the local Board of Education, will be received until noon, June 10. Bids are to be submitted covering cost of delivery in the bins at the several schools and also f.o.b. Dayton, Ohio. Address Clk. C. J. Schmidt, Bd. of Edu., Dayton, Ohio.

+No. 696—Salem, Mass.—The bids on this contract (p. 877), which provides for furnishing the County Commissioners with 2000 tons of steam coal and 100 tons of anthracite, were: John Girdler, Georges Creek, Cumberland, $4.55 to $4.65; G. L. Gage Co., New River Coal, $4.95; Cross Coal Co., New River coal, $4.95; Atkinson Coal Co., New River coal, $4.70 to $4.42; Theberge Bros., New River coal, $5.14; Charlotte Fairfield, anthracite, $6.85; M. O'Mahoney, anthracite, $8.45; E. H. Humphrey, $7. Address Clk. H. E. Thurston, Essex County, Salem, Mass.

+No. 706—New York—Owing to a legal technicality it has been decided to readvertise for bids on this contract (p. 915). Complete list of bids on the original contract was made up ready for publication, but withdrawn when it was announced that all bids would be rejected. Copies of the original bids will be furnished interested parties on application to "Coal Age." Slight changes in the tonnages required are to be made and it is expected the new bids will be opened at noon on June 8. Specifications will be ready in a few days. Address F. R. Leach, Secy., Central Purchasing Committee, Room 1226, Municipal Bldg., New York City.

No. 726—New York—This contract (p. 916), which provides for furnishing coal for fireboats, calls for 5300 gross tons of anthracite egg or stove size, to be delivered at three points, on or before Apr. 1, 1916. Bids are to be opened at 10:30 a.m. June 1. Address Fire Comr. Robert Adamson, Municipal Building, New York City.

New Business

+No. 756—Cedar Rapids, Iowa—The Iowa Ry. & Light Co. at this place will contract some time next month or in July for approximately 75,000 tons of 1½-in. screenings. Address Iowa Ry. & Light Co., Cedar Rapids, Iowa.

+No. 757—Bloomfield, Iowa—The City Electric Light & Water Plant at this place will be in the market some time during next month for 2500 tons of coal. The business is done on a competitive basis, and Novinger, Mo., mine-run coal is customarily used. The present coal was bought at $1.67 per ton at the mine; the freight rate is 50c., and the wagon haul 28c. per ton. Address Treas. R. C. Bristow, City Light & Water Plant, Bloomfield, Ia.

+No. 758—Springfield, Ohio—Bids will be received by the trustees of the local hospital until noon, June 15, for furnishing the coal required during the period ending June 1, 1916. Address Clk. William H. Mahoney, Hospital Bd., Springfield, Ohio.

+No. 759—Waterbury, Conn.—The Board of Education at this place will be in the market some time during June for approximately 2000 tons of Lehigh stove coal. The business is let on competitive bids among the local dealers. Address Comptroller of City, Waterbury, Conn.

+No. 760—New Bedford, Mass.—The Board of Education at this place will be in the market some time during next month for 2600 tons of Lehigh egg coal, which is usually bought at about $6.95 per ton. The call for bids is advertised in the local papers, and the business done on an annual contract. Address Committee on Fuel, City Council, William St., New Bedford, Mass.

+No. 761—Webster City, Iowa—The Electric Light & Water Works Plant at this place will be in the market some time next month for about 4600 tons of mixed steam coal, which is usually purchased at $1.20 per ton. The call for bids is advertised. Address Webster City Electric Light & Water Works Plant, Webster City, Iowa.

+No. 762—Springfield, Tenn.—The City Water Works & Electric Plant at this place will be in the market some time during next month for approximately 2500 tons of western Kentucky mine-run coal. A very high grade product is required, and the usual price is about $2 per ton f.o.b. Springfield. Address City Water Works & Electric Plant, Springfield, Tenn.

+No. 763—Americus, Ga.—The Local Water & Light Plant at this place will be in the market some time during the summer for 4000 tons of steam coal, and 1800 tons of gas coal. The business is usually done at about $3 per ton on the steam grade, and $3.70 per ton on the gas coal. Address the City Water & Light Plant, Americus, Ga.

+No. 764—Franklin, Ohio—The contract of the Franklin Board & Paper Co., at this place, expires on July 1, and bids will be received on June 1. Its requirements are about 1000 tons of nut and slack coal per year. Address Secy. Fred. B. Zartman, the Franklin Board & Paper Co., Franklin, Ohio.

+No. 765—Martinsburg, W. Va.—Bids will be received until noon, June 14, for furnishing the local Board of Education with seven carloads of Georges Creek Coal. Quotations should be made f.o.b. Martinsburg. Mine-run coal is required, and bidders should specify the mines from which they propose furnishing the coal. Adress Secy. W. A. Pitzer, Bd. of Edu., Martinsburg, W. Va.

+No. 766—South Bethlehem, Penn.—Sealed bids were received up to May 28 for furnishing 30 tons of pea coal, 20 tons of chestnut and 10 tons of stove, for the Northampton Heights schools. Address Secy. George E. Borman, Bd. of Edu., South Bethlehem, Penn.

+No. 767—Welland, Ont., Can.—Bids will be received until noon, June 2, for furnishing the county buildings with about 200 tons of anthracite coal. Address County Clk. Robert Cooper, Welland, Ont., Can.

+No. 768—Washington, D. C.—Sealed proposals will be received until noon, June 16, for furnishing the Government 4000 short tons of bituminous coal. Variations of 20% greater or less than this amount may be required at the option of the Government. Address Col. H. C. Newcomer, Corps of Engrs., Room 305, Southern Bldg., Washington, D. C.

+No. 769—Towson, Md.—Sealed proposals were received until 11 a.m., May 26, for furnishing Baltimore County with coal as follows: 35 tons of white ash, 10 tons of nut, 80 tons No. 1 white ash, 40 tons No. 3 white ash, 160 tons No. 1 white ash. Deliveries are to be made in some instances, and in others quotations should be f.o.b. railroad switch. Bidders should specify exactly what coal they propose furnishing. Address Chief Clk. C. W. J. Fox, County Comrs., Towson, Md.

+No. 770—Peterboro, Ont., Can.—Sealed proposals were received until noon, May 26, for furnishing 600 tons of either select three-quarter Youghiogheny lump or smokeless coal, to be delivered to the local schools as required. Address Secy.-Treas. G. H. Thompson, Bd. of Edu., Peterboro, Ont., Can.

+No. 771—Waynesboro, Penn.—Bids were received until 6 p.m., May 27, for furnishing the schools of Washington Township with coal during the coming school year. Address Henry Hess, Bd. of Edu., Waynesboro, Penn.

+No. 772—Boston, Mass.—Sealed proposals will be received by the Metropolitan Water and Sewerage Board until 1:30 p.m., June 2, for furnishing coal as follows, in gross tons: For Water-Works at Chestnut Hill Pumping Station, 5000 tons; at Arlington Pumping Station, 450 tons; at Hyde Park Pumping Station, 150 tons; at Spot Pond Pumping Station, 800 tons; at Natick Station of Boston & Albany R.R., 80 tons; sewerage works at Deer Island Pumping Station, 2700 tons; at East Boston Pumping Station, 3000 tons; at Charlestown Pumping Station, 1200 tons; at Alewife Brook Pumping Station, 425 tons; at Ward Street Pumping Station, 2300 tons; at Quincy Pumping Station, 450 tons; at Nut Island Screen House, 550 tons. Specifications and complete information may be had on application. Address Secy. William N. Davenport, Metropolitan Water and Sewerage Bd., 1 Ashburton Place, Boston, Mass.

+No. 773—Denver, Colo.—Bids will be received by the Board of Education at this place for furnishing fuel to the local schools during the fiscal year beginning June 1, until noon of that day. Address Secy. W. A. E. Stutt, Bd. of Edu., 19th and Stout St., Denver, Colo.

+No. 774—Washington, D. C.—Sealed proposals will be received by the Department of the Interior until 2 p.m., June 22, for furnishing the Indian Service with approximately 106 tons of blacksmith coal, 38,763 tons of bituminous coal and 4947 tons of anthracite; the contract is to run during the fiscal year beginning June 30. Schedules giving all the necessary information may be had on application and bids should be submitted on government blanks. Address Indian Office at Washington, D. C., or United States Indian Warehouses at Chicago, St. Louis and San Francisco.

+No. 775—North Yakima, Wash.—The Board of Education will receive bids until 7 p.m., June 3, for furnishing and delivering approximately 800 tons of coal to the various school buildings in the district. All bids must be accompanied by a certified check for 5% of the bid, and complete descriptions of the coal must be included. Address Secy. B. F. Kumler, North Yakima, Wash.

+No. 776—Ridgefield Park, N. J.—Sealed bids will be received until 8:30 p.m., June 11, for furnishing approximately 300 tons of coal to the local schools during the ensuing year. White ash, pea, stove, nut and egg coal are required, and deliveries are to be made as directed. Address District Clk. G. H. Noethling, Bd. of Edu., Overpeck Township, Ridgefield Park, N. J.

+No. 777—Washington, D. C.—Sealed proposals will be received until 2 p.m., June 1, for furnishing approximately 25,000 tons of bituminous coal to the U. S. Capitol Power Plant during the fiscal year ending June 30, 1916. Bids should be made on the long-ton basis and all bidders must specify the name of the coal and location of their mines. Quotations should be made on sidings at the Capitol Power Plant, situated in Garfield Park. All proposals must be accompanied by a certified chick for $100. Address Elliott Woods, U. S. Capitol Bldg., Washington, D. C.

+No. 778—Lapeer, Mich.—Sealed bids will be received by the Michigan Home and Training School until 10 a.m., June 10, for furnishing the Institution with approximately 7000 tons of bituminous, nut, pea, and slack and 100 tons of No. 1 chestnut (anthracite) coal. Bids must be submitted on blank forms which may be obtained on application. Address Steward H. S. Evans, Michigan Home and Training School, Lapeer, Mich.

+No. 779—Onawa, Iowa—Bids will be received until June 7 for furnishing the local Electric Light Plant with coal during the fiscal period beginning June 1 of the current year and ending Mar. 31, 1916. Address City Clk. C. L. Collins, Onawa, Iowa.

+No. 780—Boston, Mass.—Sealed proposals were received until noon, May 27, for furnishing the Suffolk County Jail with 650 tons of furnace coal, 100 tons of screening and 300 tons of Pocahontas or New River semibituminous. The price should include cost of delivery and be made on the gross ton basis. All proposals must be accompanied by a certified check for $300 and a bond for one-quarter the amount of the contract must be furnished by a satisfactory surety company. Address Sheriff John Quinn, Jr., Court House, Pemberton Square, Boston, Mass.

+No. 781—Seattle, Wash.—Sealed proposals will be received by the United States Army until 11 a.m., June 2, for furnishing 158,500 lb. of the best quality Cumberland (or equal) smithing coal sacked for delivery to various army posts in Alaska, Washington, Wyoming, and on the Puget Sound. Deliveries are to be made during the fiscal year commencing July 1. Bids should be made on the basis of 100 lb. including cost of sacks, and the Government reserves the right to vary its requirements, as stated, 20%. Blank forms and specifications may be had on application. Address Col. George B. Davis, Depot Quartermaster's Office, U. S. Army, 3122 Arcade Bldg., Seattle, Wash.

Contracts Awarded

Note—Successful bidders are noted in **bold face type.**

+No. 461—Boston, Mass.—This contract (pp. 627, 748, 794), which provides for furnishing and delivering 41,300 tons of coal to the various city departments has been awarded as follows: **Metropolitan Coal Co.,** Children's Institute (800 tons) $4.09; Ferry Service (11,000 tons) $3.74; Calf Pasture Sewer Division (8000 tons) $3.75. **Darrow-Mann Co.,** Penal Institute, (6500 tons) $3.70. **Gorman-Leonard Coal Co.,** Infirmary Department (6000 tons) $3.84; City Hospital, (9000 tons) $3.76. Address Supt. of Supplies D. Frank Doherty, Room 808, City Hall Annex, Boston, Mass.

+No. 668—New York, N. Y.—This contract (p. 836), which provides for furnishing white ash anthracite and Cumberland coal, has been awarded to **J. S. Conabeer,** for $8558.25. Other bidders on this contract were: O. J. Stephens, $8695.70, and Burns Bros., $9120. Address Pres. Douglass Matthewson, Crotona Park, 177th St. and Third Ave., New York City.

+No. 669—Sleepy Eye, Minn.—This contract (p. 669), which involves approximately 1000 tons of steam coal for the Electric Light Plant, has been awarded to **R. H. Bingham & Sons** on Youghiogheny 2-in. screenings at $4.20 per ton f.o.b. Sleepy Eye. Address City Recorder H. Peterson, City Council, Sleepy Eye, Minn.

+No. 674—New York—The lowest bids on this contract (pp. 795, 876), which provides for furnishing the fuel requirements of the local Board of Education, were as follows: MANHATTAN BOROUGH—Entire Borough, Burns Bros., $152,308.90. The total of lowest bids by items is $716.40 less than the lowest borough bid, as follows: Broken coal, Burns Bros., $106,930; egg coal, George D. Harris & Co., $187.50; stove coal, Harris & Co., $1875; pea coal, Burns Bros., $11,475; No. 1 buckwheat, Harris & Co., $26,625, and semibituminous, Harris & Co., $4500. BOROUGH OF BRONX—Burns Bros. are the lowest at $55,784.25, or $1255.75 less than the next lowest bid. For supplying 3000 tons No. 1 buckwheat, M. L. Bird bid $140 less than Burns Bros., and on 4800 tons of No. 1 buckwheat he bid $60 less than Burns Bros. BROOKLYN BOROUGH—Bacon Coal Co. bid $143,524.80. The lowest bids by districts were: No. 1, A. J. & J. J. McCollum, $39,245.40; No. 2, J. F. Schmadeke, $51,455; No. 3, McCollum, $32,793.30, and No. 4, Schmadeke, $22,815; a total of $146,408.70. BOROUGH OF QUEENS—Entire borough, Bacon Coal Co., $83,577. Lowest bidders by districts were: No. 1, Burns Bros., $29,408.90; No. 2, S. Tuttle's Son & Co., $28,780.50, and No. 3, Tuttle's Son & Co., $25,295.50. BOROUGH OF RICHMOND—Richmond Ice Co. was the only bidder, at $20,140.25. Address Supt. of School Supplies Patrick Jones, Park Ave. and 59th St., New York City.

LATER—Awards have been made as follows: MANHATTAN, **Burns Bros.**, $152,308.90; BRONX, **Burns Bros.**, $55,784.25; BROOKLYN, **Bacon Coal Co.**, $143,524.80; QUEENS, excepting 3000 tons of semibituminous coal, **Bacon Coal Co.**, $72,057; **George D. Harris & Co.**, 3000 tons semibituminous coal, $11,520. The bid of Richmond Ice Co. of $20,140.25 for Borough of Richmond was laid over for further consideration. Address Supt. of School Supplies Patrick Jones, Park Ave. and 59th St., New York City.

+No. 698—Toronto, Ont., Can.—This contract (p. 877), which provides for furnishing about 500 tons of semibituminous coal, has been awarded to local agencies. Address Secretary, Public Library, College St., Toronto, Ont., Can.

+No. 703—Lowell, Mass.—This contract (p. 877), which provides for furnishing the Lowell Jail and the Training School of North Chelmsford with coal, has been awarded as follows: **Fred Horne,** 150 tons of bituminous at $4.94, 20 tons of anthracite furnace at $6.70; **John P. Quinn,** 500 tons of bituminous at $4.94, 20 tons of anthracite furnace at $7, 30 tons of stove at $7.30. Fred Horne's contract covers the Lowell Jail and the John P. Quinn contract provides for the requirements of the Training School. Address County Commissioners, Middlesex County Court House, Lowell, Mass.

No. 708—North Adams, Mass.—The contract (p. 878), which provides for furnishing coal to the several public buildings at this place has been awarded to **W. J. Nichols** on the following basis: Egg and stove $6.15 per ton; chestnut, $6.40; bituminous, $4.15. This was the lowest of the four bids submitted. Address Com. of Pub. Wks. John Martin, North Adams, Mass.

+No. 712—Boston, Mass.—This contract (p. 878), which provides for furnishing the local Immigration Station with 250 tons of anthracite egg coal, has been awarded to the **Burton Furber Coal Co.** at $6.87 per gross ton. Other bids on this contract were: Wellington Wilde Co., $6.90; Metropolitan Coal Co., $6.97; Chelsea Iron & Coal Co., $7.75. Deliveries are to be made as ordered. Address Commissioner of Immigration, Long Wharf, Boston, Mass.

No. 737—Charleroi, Penn.—This contract (p. 917), which provides for furnishing the local school board with coal during the ensuing year, had been awarded to **T. J. Crombie** at $5.73 per ton of mine-run. Other bidders on this contract were John Redd, $6.25; Charles Reid, $5.74. Address Secy. T. M. Faddis, Bd. of School Directors, Charleroi, Penn.

Contract Notes

Buffalo, N. Y.—The city Fire Department received only one bid for supplying its anthracite requirements, this being from C. A. & M. Kaiser, $5.40 per ton for stove and egg sizes and $5.65 for chestnut, covering April, 1915, with the usual 10c. sliding scale. For bituminous the lowest bidder was the Rochester & Pittsburgh Coal & Iron Co., $4 per ton for selected, hand-picked lump; $2.90 for lump screened and delivered to the fire boats.

Washington, D. C.—Telegraphic bids were requested by the Navy Department for either the transportation of coal, or the coal and transportation, for delivery at the Naval Coaling Depot, Key West, Fla. Coal must be of the Navy standard, and bidders were requested to state the name of the mines from which the coal originates, name of the company, etc. The tonnage involved aggregates approximately 5000 tons and delivery is to be made between June 1 and 15. A daily discharge rate of 350 tons is guaranteed at Key West. Telegraphic bids were also requested until noon May 5 for the transportation of one cargo of coal (5000 to 7000 tons) from the Atlantic Range ports to the Naval Coaling Depot, San Diego, Calif., or Tiburon, Calif. A daily discharge rate of 400 tons is guaranteed. Address Paymaster Gen. Navy., Samuel McGowan, Navy Department, Washington, D. C.

Buffalo, N. Y.—Pickands, Mather & Co. has announced the following prices for Lake steamboat fuel for the season of navigation, delivered to bunkers: $2.80 for three-quarter, $2.70 for mine-run and $2.50 for slack. This is 10c. less than for last season. The three-quarter size is in most use.

Mechanicsville, N. Y.—The contract for the annual supply of coal for the Board of Education at this place has been awarded to **W. G. Morton,** of Albany at $4.10 for pea coal, and $5.45 for egg coal. The contract calls for 350 gross tons of pea, and 150 tons of egg.

New Haven, Conn.—The contract for furnishing 544 tons of coal to the Public Works Department at this place has been awarded to **A. H. Powell Co.,** the total consideration being $2,265.60.

Washington, D. C.—The Navy Department received telegraphic bids until May 15 for transportation of one cargo of coal of from 5000 to 7000 tons from the Atlantic range ports to the Naval Coaling Depot, San Diego, Calif.

Baltimore, Md.—Baltimore City has awarded the contract for supplying coal to the city water-pumping stations to the **Cumberland Coal Co.,** at from $2.90 to $2.92, according to location. The Bay View Hospital contract was given to the same company at $2.90, and the Cumberland company will also supply the schools of the six city districts at prices ranging from $3.35 to $3.45. The contracts cover about 40,000 tons. The George's Creek Coal Co. will supply the ice boats and harbor tug at $2.95, and the Enterprise Fuel Co. the Health Department tug at $2.92 a ton.

+Buffalo, N. Y.—As a result of irregularity in bids, the award of the contract for the County Institutions which was to have been made on May 21 has been postponed for a week, and it is expected that one or more of the bids will be thrown out.

+Trenton, N. J.—The local School Board has awarded the contract for 450 tons of coal for delivery at the schools in Hamilton Township, to the Tattersall Co. and Anderson Bros., on the basis of $5.81 for Highland coal and $5.25 for Jeddo.

Albany, N. Y.—Bids for furnishing the City Hall, Fire Department, Pumping Station and Filtration Plant with 600 tons of coal were as follows: Frank Dessault, $4233.75; F. B. Peck Coal Co., $3878.45; M. V. Van Santvoord, $4035.35; F. B. Marsolais, $4224.25; M. S. Younglove Coal Co., $3956.90.

Export Trade—Press reports are to the effect that the Consolidation Coal Co. will supply 150,000 tons of coal to Italy and the Berwind-White Co. 50,000 tons.

New York—The Vernon Metal & Produce Co., 90 West St., announces the appointment of Hugh L. Kirby as manager of their coal department. They specialize on New River smokeless coal.

Brazil—The Central Ry. of Brazil, a Government line has recently approached an American concern here with a proposition to purchase 20,000 tons of American Pocahontas coal. The price is said to be $15.09 per ton. The Central Ry. has had special permission from the Government to make its purchases of coal for cash, and to meet payments therefor out of its actual cash receipts, month by month. The director of the road states that it consumes 300,000 tons of coal per year.

New York—Bids were opened May 6 in the office of the United States Coast Guard Service for supplying bituminous coal for the revenue cutters in this harbor, with the following result: George D. Harris & Co., $3.10 per ton in bunkers at dock; $3.69 in bunkers in stream. C. J. Wittenberg, $2.98 and $3.86 respectively; Commercial Coal Co., $3.48 and $3.56 respectively; Penn Fuel Co., $2.90 and $3.75 respectively. Deliveries are to begin July 1.

Argentina—Two offers for the supply of 25,000 tons of steam coal were presented to the Argentine Minister of Public Works at the end of last week—one from a British firm and the other from a North American. The latter offer is understood to have been the more favorable one.

POSITIONS WANTED

AS ENGINEER AND SUPERINTENDENT; 21 years' experience in coal mines; excellent references on request. P. W. 408, Coal Age.

AS CHIEF ELECTRICIAN; 31 years of age; strictly sober; 12 years' practical experience winding, installing and maintaining electrical mining equipment; can handle men and get results; can give reference. P. W. 412, Coal Age.

COAL MINE MANAGER open for engagement June 15; 32 years old, married, technical graduate. Experience in Pennsylvania, Kentucky, Arkansas, Oklahoma and Nova Scotia. Can handle men. References. P. W. 414, Coal Age.

EXPERIENCED MINE SURVEYOR and mapper desires position with established coal company; $125 per month. Capable to take charge of all engineering work about coal mines. References. P. W. 415, Coal Age.

A FIRST-CLASS ELECTRICIAN AND MACHINIST wants position with a large coal company; age 33; sober and reliable; technical education in electrical and mechanical engineering, 16 years' experience in upkeep, armature winding and all other possible repairs; experience with all makes of mining machines and haulage motors; experience in installing power and substations; reference. P. W. 417, Coal Age.

MINING ENGINEER OR SUPERINTENDENT, 31, married, desires change. Technical education. Varied experience in bituminous mines, prospecting to operation. Specialty construction. P. W. 416, Coal Age.

CONTRACTS TO BE LET

Bids received until June 10, 1915.

Coal Proposals Wanted

BITUMINOUS AND ANTHRACITE

Lapeer, Mich.

Sealed Proposals will be received by the Board of Control of the Michigan Home and Training School (a State institution), Lapeer, Michigan, until ten o'clock A.M. Thursday, June tenth, 1915, for furnishing the institution full requirement of nut, pea and slack (bituminous) coal for the year beginning July 1st, 1915. Approximate requirement 7000 tons.

Sealed proposals will be received at same time for 100 tons No. 1 Chestnut (anthracite) coal.

Proposals must be made on blanks furnished by the institution.

For blanks address H. S. EVANS, Steward, Lapeer, Michigan.

⁂

PROPOSALS FOR COAL—Department of the Interior, Office of Indian Affairs, Washington, D. C., May 20, 1915.—Sealed proposals, plainly marked on the outside of the sealed envelope: "Proposal for coal," and addressed to the "Commissioner of Indian Affairs, Washington, D. C.," will be received until 2 o'clock p.m. Tuesday, June 22, 1915, and then opened, for furnishing the Indian Service with, approximately, 106 tons blacksmith coal, 38,763 tons soft coal, and 4947 tons hard coal during the fiscal year ending June 30, 1916. Bids should be made out on Government blanks. Schedules giving all necessary information for bidders will be furnished upon application to the Indian Office, Washington, D. C., and the U. S. Indian Warehouses at Chicago, St. Louis, and San Francisco. The department reserves the right to reject any and all bids, or any part of any bid. CATO SELLS, Commissioner.

FAIRMONT W.VA.

June 5, 1915.

Coal Mine Owners and Operators,
Everywhere in America.

Gentlemen:-

YOU have difficult problems to solve in the development of your coal mines and in the mining and preparing of your coal for market.

WE have an Engineering Department devoted exclusively to the design of Up-to-the-Minute Coal Handling Equipment and every man in the department is a specialist in that line.

YOU have YOUR problems, WE have the means of solution of YOUR problems--Why not start a "Lets-get-together" game right now.

YOU tell us what your problems are and what you want to accomplish and WE will do the rest.

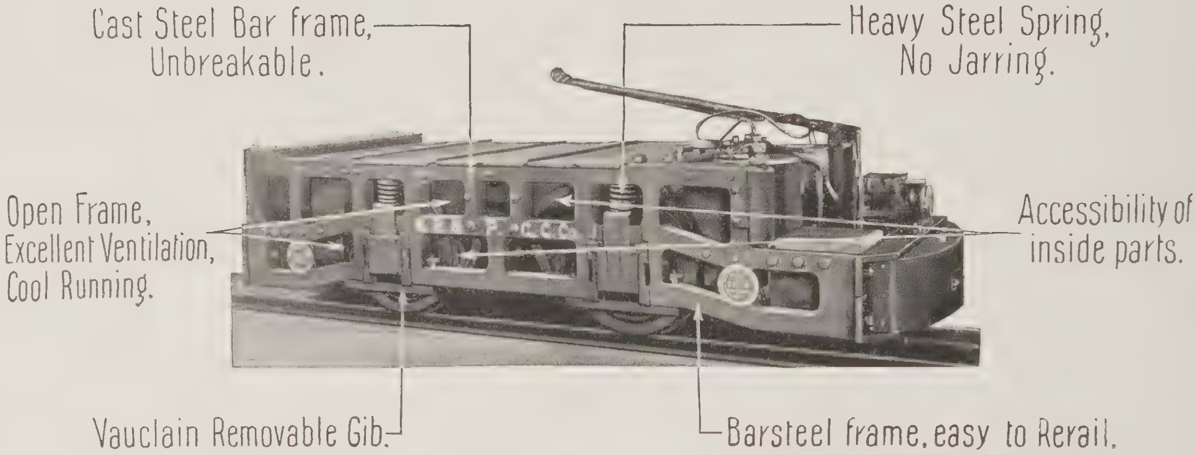
FAIRMONT Tipple Equipments, Car Hauls and Conveyors are designed to meet the most exacting demands and deliver all grades of coal to the railroad cars in such a manner that your Sales Department can guarantee absolutely clean coal properly sized and have no apologies to make when the coal is delivered.

Soliciting your inquiries for either new or improvement work, we are,

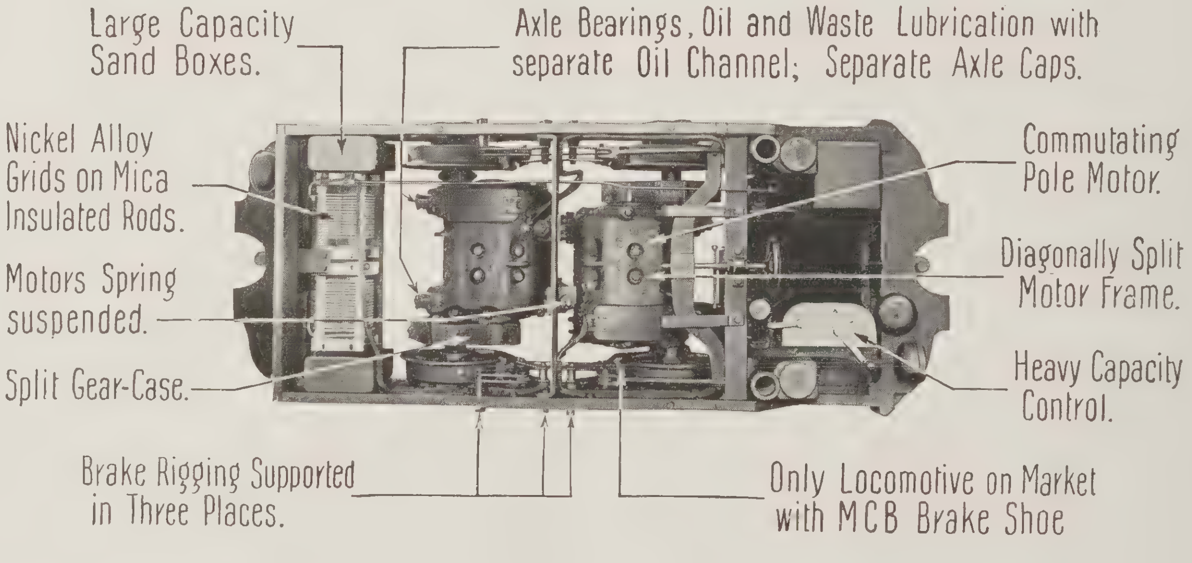
Yours very truly,
FAIRMONT MINING MACHINERY CO.

P.S. All up-to-date mines should be equipped with Fairmont Steel Ties, Railroad Car Retarders, Portable Electric Gathering Pumps and the other "FAIRMONT SPECIALTIES." If you are not using them you are dropping behind in the race for reduced costs and efficiency. "Let's get together."

Barsteel Locomotive Advantages
Reliability plus Accessibility



Cast Steel Bar frame, Unbreakable.
Heavy Steel Spring, No Jarring.
Open Frame, Excellent Ventilation, Cool Running.
Accessibility of inside parts.
Vauclain Removable Gib.
Barsteel frame, easy to Rerail.



Large Capacity Sand Boxes.
Axle Bearings, Oil and Waste Lubrication with separate Oil Channel; Separate Axle Caps.
Nickel Alloy Grids on Mica Insulated Rods.
Commutating Pole Motor.
Motors Spring suspended.
Diagonally Split Motor Frame.
Split Gear-Case.
Heavy Capacity Control.

VOLUME 7 JUNE 6, 1915 NUMBER 23

CONTENTS

WITH PRINCIPAL ARTICLES SUMMARIZED

*Illustrated Article

FOREWORD: *Page* 959
Pertinent remarks relative to first-aid and efficiency in coal-mining plants. Also a thought concerning the employment of old men who, although not in their prime physically, possess a vigorous mentality and a ripe practical experience. COAL AGE, Vol. 7.

*EVOLUTION OF COAL PREPARATION IN WEST VIRGINIA: *Pages* 960-964
Within a comparatively short time the demand for coal has changed from run-of-mine to prepared sizes. The first attempts at preparation were by means of bar screens. At the present time, however, these have given way to shaking screens, picking tables, loading booms and other devices, the object of which is to secure a clean and large-sized product. H. Reisser. COAL AGE, Vol. 7.

EXTRACTS FROM A SUPERINTENDENT'S DIARY: *Page* 964

DRY CLEANING BITUMINOUS COAL WITH SPIRAL SEPARATORS: *Page* 964
J. V. Freeman.

*RETARDING CONVEYOR AT A WEST VIRGINIA MINE: *Pages* 965-966
An interesting installation where coal is lowered without breakage from the pit mouth on a hillside to railroad cars in the valley below. The rope conveyor is 1410 ft. long. This is supposed to be the longest retarding conveyor ever installed. William Brasack. COAL AGE, Vol. 7.

GERMAN BYPRODUCT PRACTICE UNDER WAR CONDITIONS: *Page* 966

*LOADING BITUMINOUS COAL: *Pages* 967-969
Modern arrangements now enable coal to be loaded into large railroad cars without subjecting the fuel to any destructive fall. Details of a new-style loading boom. Miner Raymond. COAL AGE, Vol. 7.

CRUSHING COAL AT THE MINES: *Pages* 969-970

*COAL PREPARATION IN THE ROCKY MOUNTAIN FIELD: *Pages* 971-973
A district where the production of lump coal is the chief requirement. Box-car loaders are employed. Details of rescreening and washing methods. Benedict Shubart. COAL AGE, Vol. 7.

MINING COMPANIES PURCHASE NEW EQUIPMENT: *Page* 973

EASTERN OHIO MINING SCALE: *Pages* 974-976
The agreement between the Association of Pittsburgh Vein Operators of Ohio and the United Mine Workers of America, with reference to the operation of their mines in Belmont, Harrison and Jefferson Counties, Ohio. This agreement went into effect May 11, 1915, and will expire Mar. 31, 1916. COAL AGE, Vol. 7.

*TIPPLE EQUIPMENT FOR A MODEST TONNAGE: *Pages* 977-978
The coal is lowered down the mountainside by an inclined plane to the tipple, where careful preparation is secured. The entire equipment was designed to handle a normal output of 200 tons per hour. E. C. DeWolfe. COAL AGE, Vol. 7.

*UTILIZING ANTHRACITE DUST: *Pages* 979-980
About one million tons of anthracite coal too fine to be marketable is produced yearly. Thus far attempts at briquetting this material have not been commercial successes. Coal-tar pitch has been heretofore used as a binder, but experiments would indicate that sulphide pitch, with a few other ingredients added, is a much better material for this purpose. J. C. Law. COAL AGE, Vol. 7.

PREPARATION OF COAL FOR MARKET: *Pages* 980-981

*SIZING AND CLEANING ANTHRACITE: *Pages* 981-982

PRODUCTION OF COAL BRIQUETTES INCREASED: *Page* 982

Give Us the Opportunity

COAL AGE

Vol. 7 NEW YORK, JUNE 5, 1915 No. 23

The Old Men

MANY MINING COMPANIES carry the idea of employing all young men to a ridiculous extreme. They contend that youth has strength, hope, ambition and enthusiasm, and that these qualities are possessed to a lesser degree by men advanced in years. Let none of us forget that in the mining business today there are scores of men of recognized merit who are well past the 60-year mark. Their physical strength may be less, but they possess vigorous mental power, a well-tempered sense of duty and a precious practical knowledge gained through years of faithful service. Efficiency, not age, should determine the worth of an employee.

First Aid

By
C. P. Shockley

I COME as a soothing angel. I am the initial step in relieving mankind's suffering caused by accidental misfortune. A few years since few but men of science could practice my art; now many know and love me. Governments, corporations, organizations, individuals are among the well-wishers of and conjointly work for my advancement. In the hot mills, in the remote workings of the mines, in all places of industry at this time am I a necessity.

I am the fruit of the power to awaken pity, to desire to be helpful, to inculcate in each the feeling of brotherly devotion.

Throughout the land men unselfishly consecrate a portion of their time that I may exist, and by my conjuration dispel the lines of class and spread o'er humankind the mantle of faith and affection.

I encourage the thought of community feeling—the bond of common interest. It is my province to establish belief that man should aid man and that my brother's welfare is my welfare.

I am an incentive to higher ideals, to more advanced education. To future generations will I be taught in all schools, that the young shall know my value.

Though I am mighty and far-reaching, yet some are greater than I. Before first-aid should come care, the exercise of which means self-preservation, and until all men assimilate this truth will I be a necessity.

Efficiency

By
Geo. N. Lantz

THE TERM "EFFICIENCY" too often brings up in the popular fancy a picture of rushing, shouting, swearing, sweating men, working to the point of exhaustion; of creaking, groaning, whizzing, grinding, crushing, overloaded machinery; of noise everywhere; of excitement and high tension; of a shop, factory or mine where every other principle is subordinate to that of "maximum output."

Maximum capacity, it is true, is one of the objects of efficiency. Efficiency often has a "punch." But it seeks a minimum cost. And cost of production includes cost of equipment, maintenance of equipment, the wages of men, the lives of men.

Efficiency does not impose impossible conditions. It does not mean more cars than the motor-brake can control on a down-grade. It does not mean the destruction of a $5,000 machine for $1,000 worth of coal. It does not mean the loss of a $100 mule to save the cost of $10 worth of labor. It does not mean "gouging" the mine for a capacity of 1,000 tons daily this month and a drop to 500 tons next month.

It does not mean waste. Efficiency means a high average. It means adequate equipment. It means well-timbered and well-lighted entries. It means recovering rails from falls. It means a careful use of supplies. It means contented workmen. Efficiency does not indulge in loud shouting and self-praise.

The mushroom is efficient. It comes up in a night, through constant, gentle and quiet pushing. Thoroughness, accuracy, consistency, cheerfulness, cleanliness, carefulness, honesty, calmness, sobriety, safety—all these are component parts of efficiency. Efficiency and good judgment are synonyms.

Evolution of Coal Preparation in West Virginia

By H. Reisser*

SYNOPSIS—Within a comparatively short time the demand for coal has changed from run-of-mine to prepared sizes. The first attempts at preparation were by means of bar screens. At the present time, however, these have given way to shaking screens, picking tables, loading booms and other devices the object of which is to secure a clean and large-sized product.

It is surprising in how short a period the demand for a better grade of bituminous coal has been evolved. It seems but yesterday that on passing through the coal fields one noticed the majority of operations of any magnitude consisting of the time-honored horn dump, made up principally of two T-rails bent to a circumference about the size of the mine-car wheels. This was placed at the side of the coal car high enough up to allow a small dumping bin to be rigged up under it, to which was fastened a chute generally of wood with a cast-off piece of sheet iron spiked to its bottom. This arrangement well served the purpose of filling the railroad cars.

If the vein of coal lay lower than the tracks, mules usually furnished the hauling power, one car at a time being the capacity. If the vein was high above the tracks a gravity plane with one or more cars in a trip was installed, the loads that went down taking up a corresponding number of empties. Then followed the "barney," or leader, which consisted simply of a huge mass of timber mounted on rollers traveling on a narrow-gage track which gradually disappeared as it neared the terminal of the run at the bottom and allowed the car or cars it brought down to travel the remaining distance to the dumping point by gravity. In some places where the vein lies too high to utilize a mechanical haul or conveyor these barneys are still in use.

The increasing demand for a bigger capacity gradually brought the "monitor" into use. This consisted usually of a large round tank much like a boiler mounted on wheels, holding from 5 to 10 tons of coal. This eliminated the necessity of bringing the mine cars down the incline and thus did away with much wear and tear and the frequent wrecks caused by their jumping the track on their way down. Furthermore the monitor in large measure removed the necessity for keeping the mine cars away from the working-faces for long periods. This method of operation made it necessary to construct bins at the top of the inclines so that the monitors could be loaded quickly and allowed the dumping of the cars to continue without interruption or delay.

Another bin at the bottom big enough to hold the contents of the monitor increased the rapidity of operation. Run-of-mine was the product secured, so that one or two more knocks for the coal didn't matter. The issue was to load the railroad cars and as many of them as possible, all the hauling, gathering, etc., being accomplished by mules and the coal being worked out by picks, which was the miner's entire tool chest.

One of the Early Chain Conveyor Installations

General View of a Chain Retarding Conveyor

With the perfection of electric transmission and later of electric gathering and haulage locomotives, cutting machines and drills, the capacities were again increased, and long chutes down the hillsides were installed as well as large bins. These became the rule of the day, the bins over the tracks being usually built so that the mine could continue to work even though railroad cars were not immediately available.

First Preparation Was by Means of Bar Screens

The opening of the West as a market for domestic coal brought the gravity bar screen into use. This usually consisted of a long run for the coal where the smaller sizes were removed and often again separated by additional screens under the larger ones.

Picking Nut and Egg Coal

For the types of tipples where the coal lay high above the tracks mechanical conveyors were tried successfully and were installed at many places. The favorite types were either double strands of endless chain with scraper flights placed between them at regular intervals or a single strand of wire rope with circular disks fastened to it at equal spacings. Both of these devices traveled in steel troughs.

These conveyors can of course be extended to almost any length by building them in two or more sections as the case may require. They are economical, durable, not liable to get out of order and often require little or no power to operate, this depending of course on the angle of inclination of the hillside.

In slope mines, chain or cable hauls bringing the mine cars up into the tipple were installed. In the tipples were located the gravity screens discharging the respective mixtures and sizes into the railroad cars.

In the Fairmont region this form of tipple still survives in many cases, owing mainly to the fact that the gas coal of this section is extremely hard and rough handling does not seem to appreciably deteriorate the product.

With the development of a market for domestic sizes of lump, egg and nut the demand for a gentle handling of the coal increased, and the gravity screening equipments did not meet the requirements. This was especially the case in the Pocahontas and New River fields, where the friability of the product is excessive. Breakage in these fields resulted in large percentages of slack, and the amount of this size produced made prices for it extremely low. Even then it was hard to dispose of.

Coking, of course, took a large amount of this slack, and the coke business was flourishing at that time. There were few operations that did not include a set of beehive ovens in the equipment. The activity in this particular branch of operations has to a large extent disappeared, for the reason that the coke was fragile and did not carry well.

The anthracite fields in Pennsylvania and the bituminous fields of Illinois had tried the shaking screen successfully, and this device began to appear in various places elsewhere with good results. The shaking screens eliminated the long runs of the gravity bar screens with the resulting smashes for the product. They consequently made a superior sized coal and more of it. The screen usually used was of a type with either round or oblong perforations, depending on what market the individual operator had for the respective sizes.

Lately these screens have been supplanted in many cases by what is known as the "flanged lip" screen, consisting of tapered slotted holes formed in steps of from 8 to 12 in. in length, thus turning over the product and removing any fines which may cling to or ride upon the larger pieces.

At the end the screens discharge into "spiral end loading chutes" which have hinged adjustable extension chutes, allowing the coning of high or low cars. These still continue to be the loading appliances for the hard veins of coal and for run-of-mine plants.

Loading Booms Take the Place of Chutes

Loading chutes for the lump and egg sizes, and in many cases for nut, are being rapidly discarded for the "hinged loading boom." This consists of a moving apron traveling partly on a horizontal fixed portion and the remainder moving on an adjustable steel frame which can be raised or lowered at will by either an electric or a hand-operated hoist.

An additional advantage of these machines is the fact that a splendid chance to clean and pick the coal can be secured by extending the horizontal portion a suitable length so as to allow three or four pickers to stand at the sides of this apron and remove all foreign material.

All operators now consider the picking of lump, egg and in many cases the nut coal indispensable and to make a perfect product install these machines at the ends of the picking tables. As an additional refinement they install short sections of screen just before the different products pass onto the tables, to remove any remaining fines which may have been made in the previous process.

The resulting amount of the refuse, draw slate, etc., is disposed of either by means of bins under the picking tables with a series of openings at the sides of the tables or by a cross conveyor which carries this product to a suitably located bin. It is either taken finally to a suitable dumping point by wagons or mine cars, or in some cases it is crushed and is used for boiler fuel.

A Double Strand Flight Retarding Conveyor Looking Uphill

Apron Conveyors Are Now Often Employed

Probably the latest development in the carrying of coal for either slope or drift openings is the apron conveyor. These machines will handle the product with less breakage than any machine yet tried, since the coal once on the apron does not move until it is discharged at the terminal end. Such conveyors are especially adaptable and satisfactory to the slope mine, since they eliminate the necessity of bringing the mine cars to the surface unless it is for repairs, and in some cases the repair shops for them have been placed underground.

In these cases the scales, if used, as well as the dumping hopper are placed at the elevation of the coal bed.

Whether it be a slope or a drift mine, apron or plate feeders can be installed under the dump hoppers. The discharge can be thus fed over a short section of either lip or bar screen, allowing the fine coal to fall upon the apron first, in this manner forming a cushion for the larger sizes going over the screen. This method gains the opportunity to clean the coal before it is placed on the shaking screens preparatory to being sized or loaded into the railroad cars.

The demand of the trade today calls for a perfectly cleaned and screened coal, and the operator offering the market such a product is the one who runs full time and gets good prices.

The demand of the operator for less breakage and a cleaner product is causing the manufacturer of coal-preparing equipment to exercise the height of ingenuity in handling, cleaning and loading the output of the mine.

⁂

Extracts from a Superintendent's Diary

During our strike last year two nonunion miners were shot while en route to work. There were a number of witnesses to the shooting, and any number of people knew all of the circumstances connected with the plot that led to the killing as well as the details of the actual murder.

Several months after the strike was called off the man who suggested the killing of the two men was arrested, and yesterday he was sentenced to life-imprisonment for his connection with the crime.

Immediately following his arrest most of the papers of the state began to print editorials deploring the fact that an arrest had been made, and some of them went farther and intimated that it was a plot of the mine owners to get further revenge upon the miners' organization, as the strike settlement had failed to crush the union completely.

Today I have found in every paper that I have been able to obtain an editorial upon the verdict, and most of them denounced the judge and the jury in no uncertain terms, and then, as if not satisfied with that, led off on long dissertations as to the terrible consequences that would surely follow because of this hounding of the union by the operators. The picture of the retribution that is to follow, suggested by some of the editorials, is almost too terrible to contemplate. Surely anyone who took the more radical of these editorials seriously should be ready and willing to take up arms against the terrible operators and drive them into the ocean.

During the progress of the trial the more conservative editorial writers argued that the case should be thrown out of court because its continuance could have no result other than to keep open old sores; the strike had been settled and the operators should be willing to forgive any overt acts and allow the miners to begin again with a clean slate. Now that the final conviction has come, even the conservative papers could not refrain from hinting that the trial looked like a frame-up by the operators.

Because of the fact that I know personally every man who was connected with the crime in any way and also know every witness and every other person who took part in the trial, I know positively that a fairer trial has never been staged and the verdict could not have been otherwise if the evidence were considered, and moreover I know that the miners know to a man that the verdict was just.

Knowing this, I am wondering what would be the inevitable result if this convicted man were pardoned by our governor as a result of popular clamor and editorial influence. Might not the time come when strikers would be so imbued with the idea that they need have no fear of the courts that all strikes might become bloody and vindictive to a degree that in comparison the present suggestions of some of the I. W. W. officials would seem tame indeed.

And as to the issue that is being raised about the revengeful operators taking an interest in the trial and thus making it impossible for the accused to receive fair treatment, pray how is anyone ever to be brought to justice if the injured ones are always to be discredited and treated like Black-Hand men without being granted a hearing or even allowed to suggest persons who should be interviewed?

⁂

Dry Cleaning Bituminous Coal with Spiral Separators

By J. V. Freeman*

Of the various methods proposed for the dry cleaning of bituminous coal, such as bumping tables, electrostatic and separation by air, the spiral separating system is one of assured practical application. This process of concentration of coal is an adaptation from the anthracite fields, with modifications so as to be applicable to bituminous coal.

A very successful installation of this spiral gravity process in Illinois is at the mining plant of the Old Ben Mining Corporation, at West Frankfort, Franklin County. The plant and details of operation have been fully described by Mr. Richards in the Success Issue of Coal Age of Apr. 13, 1915, by Mr. Hall in Vol. 3, page 719, and by Mr. Buchannan, who first developed it on a large scale and who relates interesting information concerning its establishment in Vol. 3, page 750.

The spiral system for the preparation of domestic coal is ideal, producing a clean, uniform-sized coal which finds a ready market. Other advantages greatly in its favor are as follows: Operates without expensive machinery and oils, the entire process depending on gravity; highly suited for the concentration of coal in dry localities, where water cannot be obtained in sufficient quantities to use the regular washing system; low labor cost; reasonable initial cost as compared with a coal washer, doing away with expensive jigs, etc.; as no water is used there is no added expense for dewatering the cleaned product.

As to the suitability of spiral separators in preparing coal for coke-oven purposes, definite and final information is yet to be had. The percentage of reduction of impurities in this method is considerably less than that of the water process. If its efficiency in this respect could be improved it would be more generally adopted, having in its favor the delivery of a coal in which the moisture content has not been increased over that of the originally mined coal.

Further, the spiral system will not admit of the treatment of fines, say coal under ⅜-in. size, nor is it possible at present to handle anything over 6 in. As in any other new process, its adaptability to treat all kinds of coal and under different climatic conditions is yet to be determined. I say climatic conditions, because extreme cold or moist conditions might retard the travel of the coal down the iron plate spirals, reducing the efficiency of separation.

*Joliet, Ill.

Retarding Conveyor at a West Virginia Mine

By William Brasack*

SYNOPSIS—An interesting installation where coal is lowered without breakage from the pit mouth on a hillside to railroad cars in the valley below. The rope conveyor is 1410 ft. long. This is supposed to be the longest retarding conveyor ever installed.

The problem of lowering the coal from the pit mouth on a hillside into the railroad cars is best solved by a retarding rope and button conveyor which delivers the coal at an even flow without any shocks to the screens or loading chute. Other methods such as inclined planes or monitor cars have the disadvantage of being intermittent, and as a consequence require storage bins and repeated dumping of the coal, besides additional labor. The longest retarding conveyor of this type ever installed, to my knowledge, was designed, built and erected by the Fairmont Mining Machinery Co. for the Carbon Coal Co., at Carbon, W. Va.

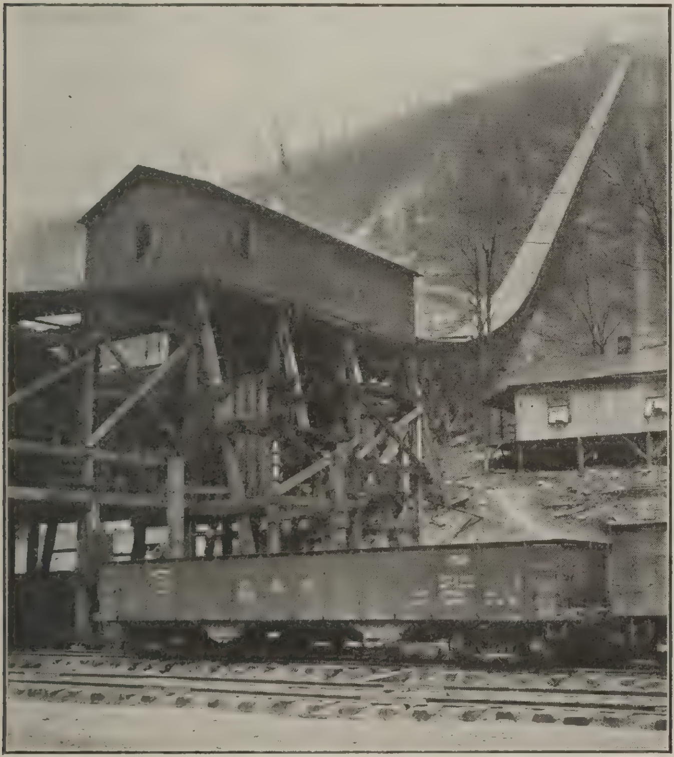

Fig. 1. Carbon Coal Co.'s Tipple and Retarding Conveyor

The equipment consists of a headhouse containing dumps, feeder and picking table, the conveyor gallery down the hill, and the tipple proper, which is equipped with shaker screens and loading booms, insuring careful screening and loading of the coal. Fig. 1 shows a general view of the plant taken just after it was put in operation.

The method of operation is as follows: Coal is brought in mine cars to the headhouse and dumped over a short chute and a bar screen 6 ft. wide and 12 ft. long, equipped with 2-in. Akron screen bars which can be set at 1 in. or 2 in. clear mesh. The slack slides over a chute onto a picking-table conveyor, while the lump is gathered in a weigh basket suspended from a tipple scale. After being weighed the lump is lowered into a feed hopper with a capacity of about two mine cars. Under this hopper runs a short apron conveyor feeder consisting of single-beaded flights mounted on two strands of steel thimble roller chain. The feeder carries the lump coal out of a 3x3-ft. opening and delivers an even flow of coal onto the picking table. As the slack has been put on the picking table before, it acts as a cushion for the lump and facilitates picking at the same time. The picking table is made of double-beaded flights mounted on two strands of steel roller chain. It is 5 ft. wide in order to spread the coal as much as possible, has a clear picking space of 15 ft. and runs at a speed of 30 ft. per min. After being picked the coal is discharged over a suitably formed chute into the rope and button conveyor.

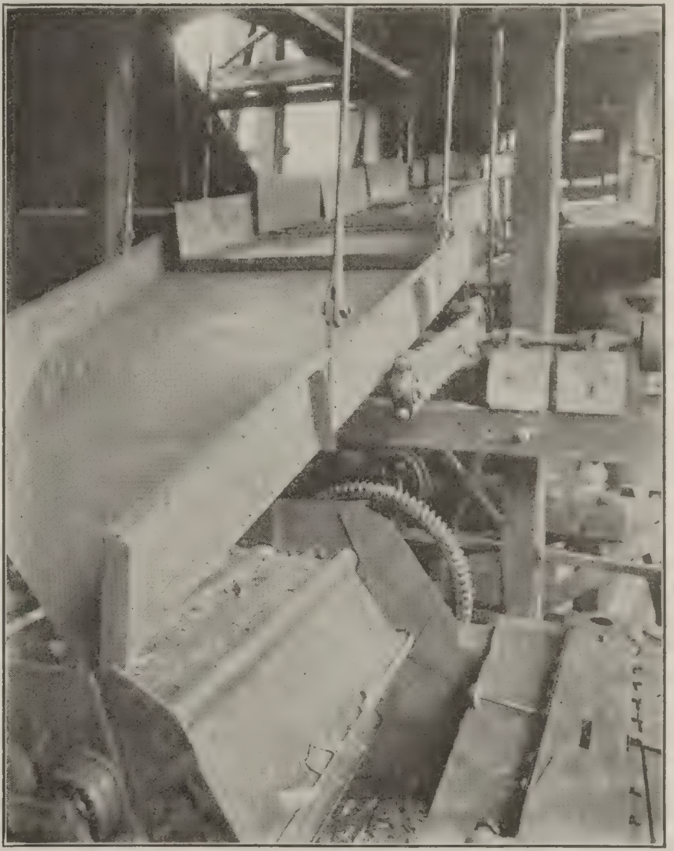

Fig. 2. Coal Is Discharged from Small Shaking Chutes to Loading Booms

Fig. 3 shows the end of the picking table with discharge chute and the conveyor rope with buttons attached, running in a steel-lined trough. The rope conveyor has a total length of 1410 ft. between sprocket centers and a slope down the hillside of 31 deg. The cable is 1¼ in. diameter and runs at a speed of 80 ft. per minute. The buttons are 12 in. in diameter and spaced 4 ft. apart.

---

*Engineer, Fairmont, W. Va.

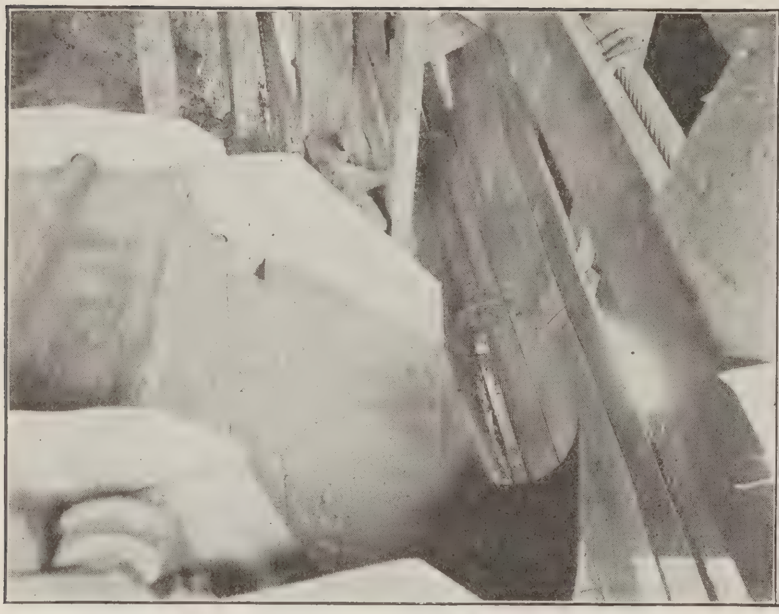

Fig. 3. End of Picking Table Showing Discharge to Rope Conveyor

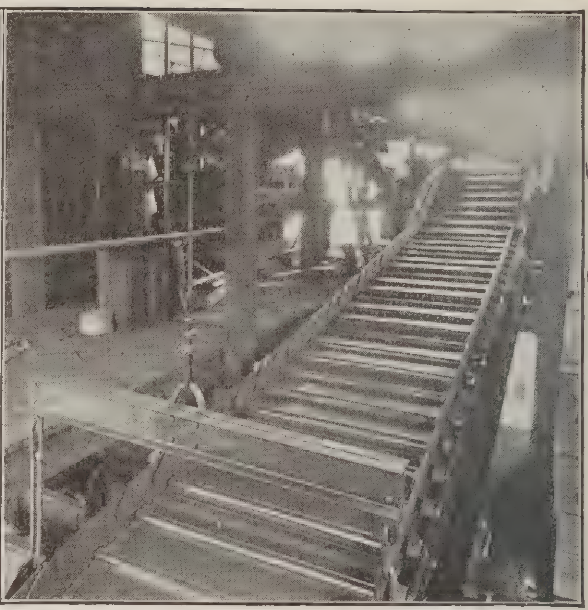

Fig. 4. Lengthwise View of Adjustable Loading Boom

Head and foot sprockets have four pockets each for the engagement of the button and are of a diameter of 5 ft. 1 in. The engaging teeth are flexible and made of manganese steel to avoid wear and tear. The conveyor is driven at the top end by two gear and one belt reductions from a General Electric 35-hp., 3-phase, alternating-current, 60-cycle, 250-volt motor, which is controlled by a self-starter with pilot circuit control.

By simply throwing in or out a knife switch at the trimmer's platform or near the picking table the motor can be started or stopped. When the conveyor is fully loaded the motor will generate power back into the line, and an electric shunt brake is provided to keep the conveyor from running away in case the power supply should fail; as an additional safeguard a hand-operated emergency brake has been installed.

Coal Is Separated into Four Sizes

At the lower end of the rope and button conveyor the coal is delivered to a set of shakers equipped with slack, nut and egg stepped screens 5 ft. 6 in. and 6 ft. wide. These are driven by eccentrics on a drive shaft running at 100 r.p.m., in turn driven through one gear and one belt reduction from a 35-hp. motor, a duplicate of the conveyor-drive motor. The screens separate the coal into four sizes—slack, nut, egg and lump. Slack and nut are delivered by chutes into bins or cars, while the egg and lump coal are discharged onto small shaking chutes with bevel discharge end, thus assuring even distribution on the loading booms without breakage.

There are two loading booms for both egg and lump coal, each 4 ft. wide and running at a speed of 40 ft. per min. Each loading boom consists of a double-beaded apron conveyor with removable sides. The hinged part is counterbalanced and suspended at the outer end by a bail from a rope leading to an electrically driven hoisting rig. The hoisting machinery is operated by a small motor and raises or lowers the boom at a speed of 15 ft. per minute. The shaker screens are equipped with veils so that any desired mixture or run-of-mine can be made.

For each loading-boom track a Fairmont railroad car retarder has been installed, which controls the railroad cars from the trimmer's platform and insures even loading and practically no drop of coal to the car. When desired, run-of-mine coal can be loaded over an emergency spiral loading chute into cars on a slack track without operating screens or booms.

The tipple equipment has a capacity of 200 tons per hour and has been in successful operation since its installation. The coal being very friable, every possible precaution has been taken to avoid unnecessary drop and breakage, and this plant may be considered one of the most uptodate of tipple equipments.

⁂

German Byproduct Practice under War Conditions

The importance of the byproducts of coke and gas works in relation to political economy in Germany has grown since the outbreak of the war. Such byproducts as benzol and tar oil replace gasoline, the importation of which has ceased, and sulphate of ammonia is taking the place of Chile saltpeter, to be used as fertilizer and in the manufacture of explosives.

For these reasons efforts are being made to increase the use of coke, in order to obtain the above byproducts. In such a way, the government buildings and railways, etc., are now obliged to use coke, together with fuel of other kinds, and orders have been issued regulating the proportion of coke to be used in the mixture. German manufacturers have followed the example of the government.

Although the change from coal firing to coke represents some difficulties, proper methods have been adopted to equalize the minor calorific value of coke. Factories with stationary boiler plants have either increased their working hours or have increased the heating surface of the boilers, and with the help of forced draft the desired horsepower can be attained.

Gas coke possesses a higher calorific value than coke-oven coke, and experience has shown that in firing locomotives, a mixture of two-thirds coal and one-third coke will insure satisfactory operation.

Loading Bituminous Coal

By Miner Raymond*

SYNOPSIS—Modern arrangements now enable coal to be loaded into large railroad cars without subjecting the fuel to any destructive fall. Details of a new-style loading boom.

The problem of minimizing breakage in the preparation of lump coal for the market has been the subject of much discussion in recent years and has had a marked effect on tipple design. It is not in the scope of this article to analyze the trade conditions which have made this point of such importance to coal producers, but rather to sketch the development of one feature of tipple design directly traceable to this insistent demand for less breakage.

From the time the coal enters the dump as run-of-mine until it reaches the end of the last screen as lump it is subjected to no great shock and the breakage is so slight as to be of little consequence. At the start, the lumps are cushioned by the finer coal, and progress over the shaking screens is no more than a slide, urged on by the vibration of the screens. In transferring the lumps from the last screen to the car, however, it is a case of "letting 'em down easy," and the old quotation, "If you can't make it easy, make it as easy as you can," is not applicable; for it must be "easy" in the fullest sense of the word if breakage is to be avoided.

The problem is requiring more and more attention with the growth of railroad equipment, as constantly greater clearances over the rails have been demanded owing to the development of coal cars from low 30-ton wooden gondolas to towering steel "hopper bottoms" of 60-ton capacity. In many cases, clearances for the passage of big locomotives are now demanded, whereas not very many years ago cars were backed in for loading. This was the case in the early tipples, wherein a straight chute was extended from the lower screen to a point 3 ft. above the car and 2 ft. to one side of the center line of the track. This allowed a drop of 3 ft. greater than the depth of the car for the first coal loaded in successive positions of the car as it was moved along under the chute.

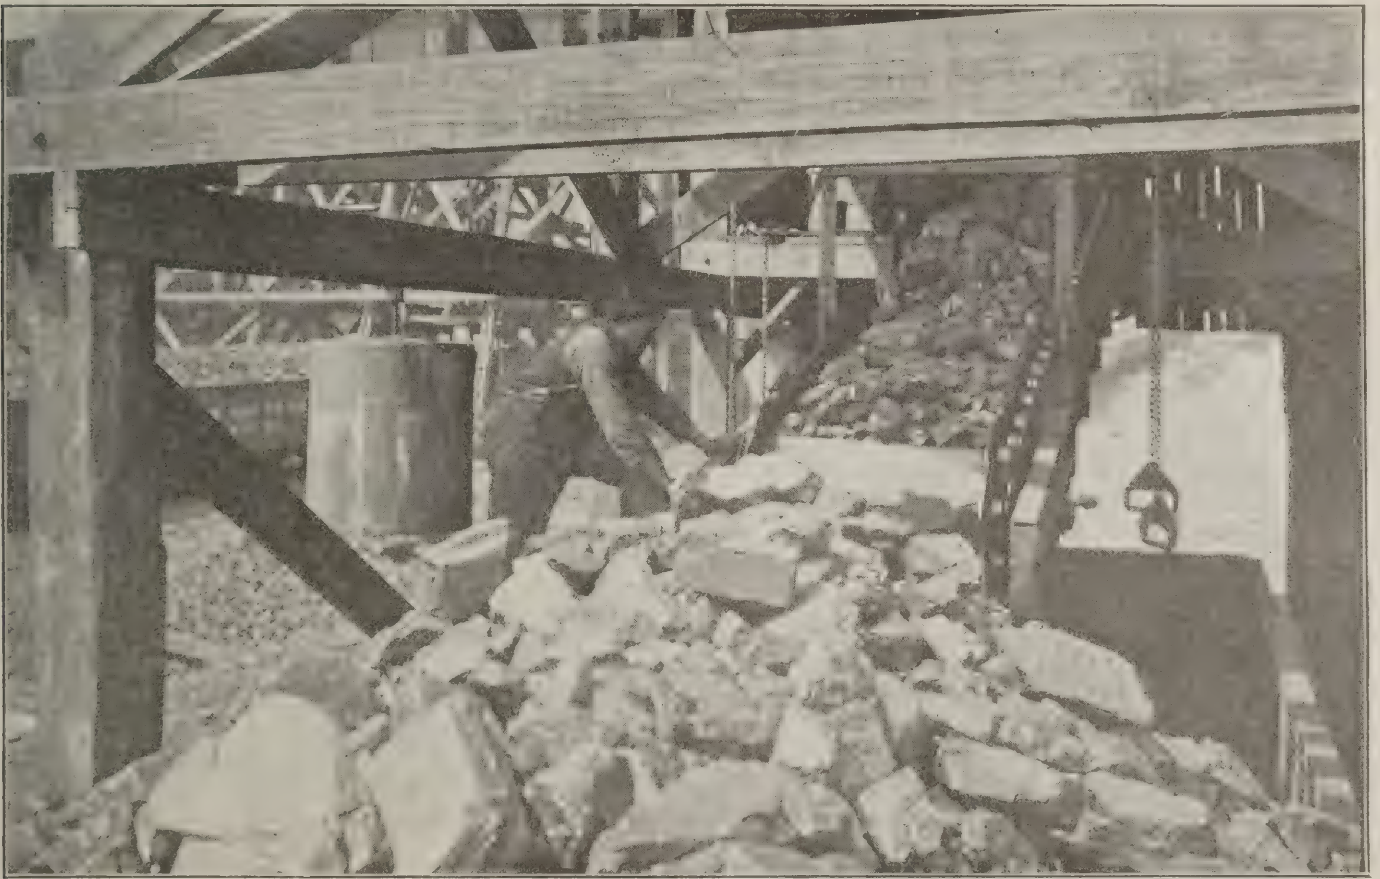

Fig. 1. Loading Boom Discharging Lump Coal to a Car. This Shows Also the Loading Boom Counterweight and the Handles Controlling the Boom Hoist

The Stages of Development

The first step in "easy loading" was to extend the end of the lower screen into a 90-deg. spiral chute terminating 3 ft. above the center of the car. With this arrangement, the coal flowed in a direction parallel to the rails and as soon as a "cone" of coal was formed in the end of the car, the latter was gradually moved along so that the lumps rolled down the pile already formed, but the drop was still as great as before, until the end "cone" was formed.

---

*Tiffin, Ohio.

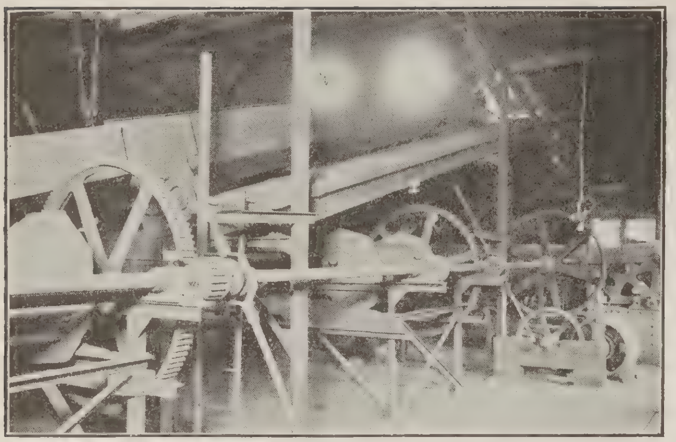

Fig. 2. Arrangement for Driving Two Booms from One Motor

When the high 50-ton cars began to appear, the rail clearances were increased and the objectionable drop became correspondingly greater. A sliding extension was then added to the spiral chute, and this arrangement overcame to some extent the breakage experienced in building up the first cone, but other than this it had no marked advantage over the spiral chute.

The modern method of loading lump is an outgrowth, not only of the earlier chutes outlined in preceding paragraphs, but also of the development of methods of picking. At first the coal was picked on the car, and later picking-belts made their appearance. About the year 1897 the old Tom's Creek Coal & Coke Co. picked the run-of-mine before screening, and used for this purpose a double-beaded apron conveyor consisting of steel pans carried between the strands of chain, the conveyor being practically identical in general construction with those used today. In the next few years, designers of tipples placed this steel picking table immediately below and at right angles to the end of the lower screen, replacing the spiral chute, but retaining the extensible chute for loading the cars.

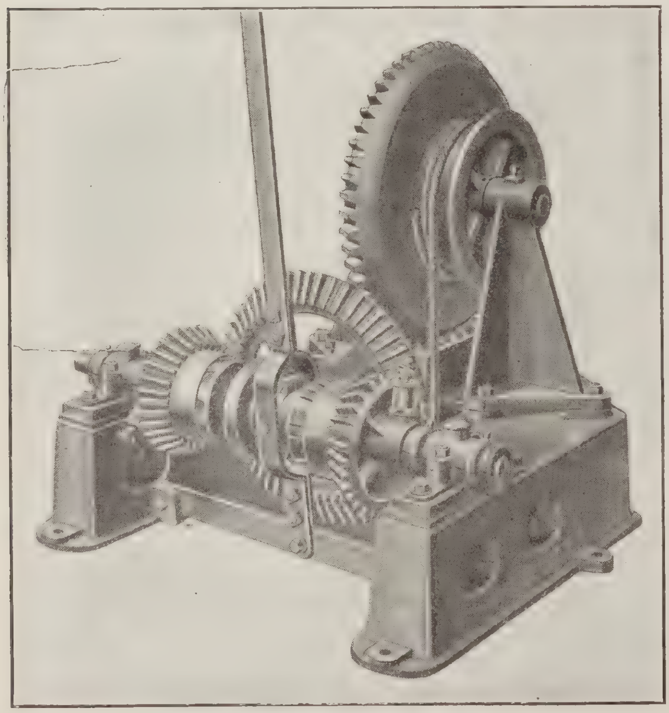

Fig. 3. The Boom Hoist

The next step in the solution of the problem brings us to modern practice. The picking table was extended to a suitable length and hinged at some point between head and foot shafts, the upper or stationary part acting as the picking table and the lower or hinged portion being mounted on a steel boom, which could be raised to a level position when not in use or lowered into the car while loading. Driving mechanisms and raising and lowering devices for this type of loader have been brought to a high state of mechanical efficiency.

The accompanying cuts illustrate some of these modern loading booms, which were made by the Webster Manufacturing Co., of Tiffin, Ohio. Fig. 1 depicts a car nearly full of lump at the tipple of the United Collieries Co., St. Charles, Va. The illustration clearly shows how the demand to "let 'em down easy" has been met. With an "empty" in position, the boom is lowered into one end of the car floor and gradually raised as the cone grows to its limit. The boom is held stationary at this point and the car is moved along until it is loaded to capacity with unbroken lump. There is no chance for breakage. Fig. 4 is from a photograph of the boom used by the Howard Colliery Co. at its Chattaroy, W. Va., tipple, and here the boom is shown free of coal and fully raised to permit the passage of a locomotive on the track beneath.

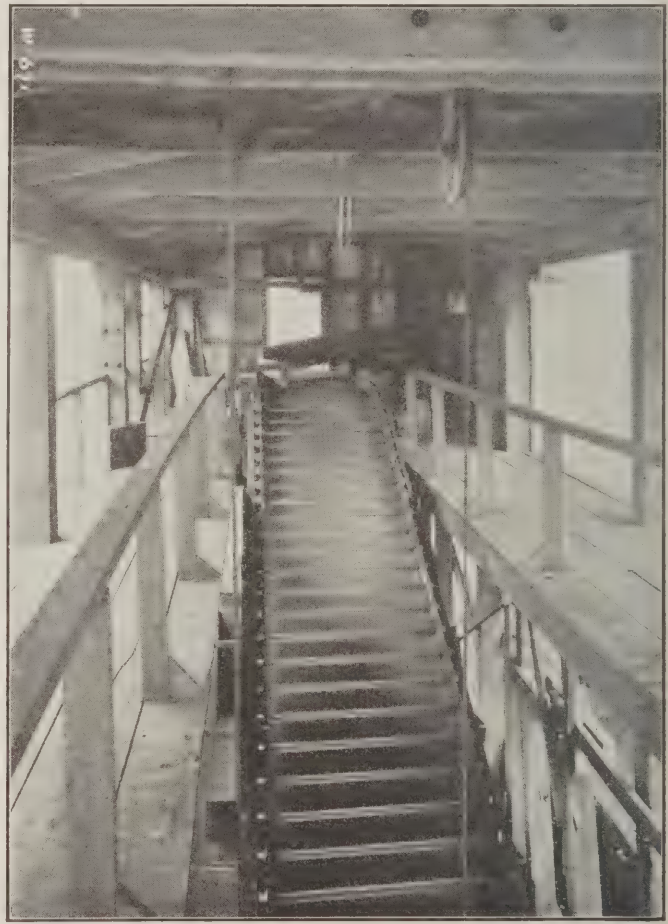

Fig. 4. View Looking Up Loading Boom

How the Booms Are Operated

In general, these booms consist of beaded steel aprons mounted between two strands of steel-bar roller chain, the inside link of the chain being extended to form the end of the pan (Fig. 4). The conveyor, with its head and foot shafts and their sprockets, is carried on a structural steel frame hinged at a point suitable for dividing the mechanism into its two component parts of stationary picking-table and loading-boom. The lower end of the boom is fitted with a bail (Fig. 4) with wire ropes leading over guide sheaves to the counterweight (Fig. 1) and to the boom hoist (Fig. 3). These hoists are reversible, the controlling lever serving to shift a double cone-clutch into one or the other of two bevel pinions which are always in mesh with a bevel gear. This gear, in turn, operates the winding-drum through a worm and wheel. This worm-gear drive also serves as a lock for the hoist in any position. The control lever is operated from the car by the handles shown in Fig. 1.

The apron is driven at the upper end. Fig. 2 shows the arrangement for driving two booms from one motor, with clutches on the driving pinions so that either one may be operated as may be desired. This view was taken in the tipple of the Standard Pocahontas Coal Co., at Caples, W. Va.

The large number of these loading-booms that have been installed in the last few years proves conclusively their great value to the mine that desires to prepare coal so that it will recommend itself to the dealer or consumer.

Crushing Coal at the Mines

By M. J. Williams*

SYNOPSIS—Many industrial plants are equipped to burn screenings, and screenings only. The supply of this grade of fuel fluctuates considerably, and but few mines are equipped with storage facilities. To these, provision for crushing the larger sizes is an economic necessity when the demand for screenings is large and the supply small.

The subject of the crushing of coal at the mines is one that most operators should be interested in for the very good reason that with the adoption of the crusher they have screenings at their command the year round.

In my opinion a crusher located at some convenient place in the tipple is as necessary to the average mine as any other piece of machinery. I shall no doubt meet with much opposition on this point as most mine owners have in the past put the crusher proposition up to the other fellow who uses the coal, to such an extent that perhaps less than 15 per cent. of the mines throughout the United States are now equipped with crushing facilities.

The purchaser of coal should be in a position to buy such fuel as he may require, but he should be compelled to pay a reasonable price, and until the mine operators adopt in some cases crushers and in others storage facilities, they cannot expect to command the right prices for their smaller grades of coal.

It is common knowledge that during the fall, winter and spring seasons the average mine is shipping such quantities of lump and sized coal that it accumulates a large tonnage of screenings or the finer grades of coal. These grades are used principally in chain-grate or other types of mechanical stokers, and as all mines are reaching their maximum production at this season of the year, it is quite natural that the market is flooded with screenings and the prices are low. Then during the summer months, when the demand for lump and sized coal falls off, the mines quite naturally cannot produce any great quantity of screenings; hence the price goes up and the production down.

How many operators have found themselves short on screening contracts in the summer and wished that they had saved some of the hundreds of tons of this fuel they dumped on the market the previous winter? I dare say that 80 per cent. of our mine owners have often come face to face with this situation.

In Chicago and vicinity ordinary screenings in the fall, winter and spring sell at ridiculously low prices, perhaps reaching at times as low as 20 cents per ton and from that price up to 50 and 60 cents; in fact, I am informed that one large power company last fall would not offer over 20 cents for screenings and got about all it could store at that figure.

At the present time screenings range anywhere from 80 cents to $1 per ton, for the scarcity is now being felt, and in another month or six weeks the percentage of screenings at the mines will be low and the prices higher. This condition I believe to prevail at the average mine.

I grant that many of the larger mine operators have realized the situation for years and have taken steps to protect their interests by storing some of their screenings during the busy season and holding them for the summer months, rehandling them into cars as desired, but the average mine, especially the smaller operation, is not prepared to store screenings, nor has the owner the inclination or capital to do so.

Storage Is Natural Solution of This Problem

Storage naturally is the greatest step toward relieving the situation, but there are three important factors to be considered in the matter of storage:

1. The enormous space required to accommodate any considerable supply of screenings.
2. The cost of necessary handling machinery for reloading screenings into cars. This will average, I would estimate, from $10,000 to $15,000.
3. The element of danger from fire in the screenings pile and the deterioration of coal so stored.

There are perhaps many other factors in this storage proposition with which I am not familiar, but I am of the opinion that storage is necessary to every mine that has the room, capital and inclination.

This coal, I am quite certain, can be rehandled from the storage pile to the cars at a price in the neighborhood of 3 or 4 cents per ton. In some instances, in large operations the cost is no doubt less, and in the smaller operations it may reach a higher figure, but 3 to 4 cents I believe to be a fair average. Of course, this rehandling must be done mechanically as far as possible, as loading such coal by hand would reach at least 15 to 20 cents per ton.

---

*Williams Patent Crusher & Pulverizer Co., Old Colony Building, Chicago, Ill.

It is my opinion that the storage proposition wherever it can be employed will be a prime factor in supplying the demand for screenings the year round and that it will be the means of keeping the price of this product at a more stationary figure, and one in which there will be at least a reasonable profit. The large industrial plants, I am sure, would much prefer to buy their coal as they require it and not put in the expensive and extensive storage systems that they are now compelled to employ. Especially is this true when conditions in the coal trade are normal.

The operator who is not prepared to use storage for want of sufficient space, capital or desire is the man most interested in the crusher. There are already many large industrial plants with sufficient storage to take care of the surplus screenings of the man without storage at his mines, and by the adoption of the crusher these operators can make small sizes, crushing at such times as they are not screening this product from their mine product and thereby filling throughout the entire year their screenings contracts at a substantial figure.

Many Types of Crushers Are Suitable

There are many different crushers that may be used for this purpose, such as the single roll, double roll, breakers with stationary arms and the hammer crushers, any of which will answer the purpose. Those who have used the hammer type, however, consider it the best machine by reason of its extra heavy construction and its facilities for trapping or throwing out the stray iron so often disastrous to the roll crusher, and also by reason of its adjustability. The hammer crushers may be adjusted and manipulated to crush in extreme cases as coarse as 8 in. in size and from that size down to 3/4 in. This same crusher may be set at any intermediate point between these limits, making a large number of given sizes and with a minimum of fines.

Of course, one must thoroughly understand the hammer mill and its possibilities in order to accomplish these results on the same crusher, but it can be done and is being done every day in the year. Hammer crushers are made in sizes to meet any capacity desired from 10 tons per hour up to 500 tons per hour.

The first question that arises in the mind of an operator considering a crusher at the mine is the cost of crushing. This compares quite favorably with storage and rehandling, for coal may be crushed at approximately 2 to 3 cents per ton, including cost of power, maintenance, interest on investment and depreciation.

The cost of power is around 3/4 to 1 cent per ton, depending upon the price of power at the mine. Oil and maintenance including labor and adjusting is 1/2 to 1 cent per ton, while interest on the investment and depreciation should not exceed 1/2 cent per. ton.

These figures I believe to be a fair average. One hundred tons of coal may be crushed per hour with less than 40 hp. As the journals are self-oiling the oil is used over and over again, and since the crusher is substantially built and adjustable, replacement of parts is but a small item, and renewal from natural wear and tear is a matter in some cases of 6 months to 1 year. As the crusher is generally located in some convenient place in the tipple the coal enters and discharges automatically, no labor being required nor are skilled mechanics necessary to attend the machine. The engineer can give it a few moments of his time at the end of each day's run.

Interest on the investment and depreciation are exceptionally small, as the sum involved in the purchase price, installation and motive power for a 100-ton-per-hour crusher does not exceed $1200 to $1500. The life of the crusher proper is unknown. All of the hammer coal crushers built 20 years ago are still in service and bid fair to continue in service indefinitely. Crushers should be properly taken care of, however, just the same as any other piece of machinery.

A Common Mistake

One great mistake made by those designing tipples is that they do not figure on the installation of a crusher in the future; consequently most crushers installed in the ordinary tipple must be set at such point as can be found for them, which in a large percentage of installations is a space not adapted to a crusher if maximum results are to be obtained. This is especially true of poor drives, inadequate head room for proper feed and insufficient fall or discharge of the coal from the crusher. I therefore suggest to all those building or designing tipples to arrange at some convenient point a suitable space for a crusher, with ample head room, proper motor or belt drive and proper discharge, for it is only a matter of time when from 40 to 60 per cent. of the bituminous mines throughout the country, especially those furnishing coal to industrial plants, will be equipped with crushers.

The crushing of coal at the mines is not a new proposition, especially at those developments controlled by large industrial corporations that cannot secure enough screenings or fine chain-grate coal to supply their boiler plants. For instance, the mines furnishing coal for the Carnegie steel plants have crushed at three or four mines almost all the coal to a 3/4-in. to 1 1/4-in. product for over 10 years and have these crushers located over both the rail and river end of each tipple. This is only one of many instances where coal is crushed at the mines.

Those industrial plants which now employ crushers at their power plants have been forced to do so principally for the reason that at times they could not secure sufficient screenings, and as an added measure of precaution have crushed lump or run-of-mine to screenings size and stored it at a time when a coal strike threatened or when there existed a scarcity of cars due to bad weather. The ordinary industrial plant will never employ these precautions, and in my opinion it is up to the coal operator to prepare his mine to deliver that product which is desired by his customer the year round, bearing in mind of course a profit on such business. There are many of us of course who would take care of our trade regardless of the cost when our customers were temporarily "up against" some unforeseen shortage. This does not apply to the coal trade alone, but to any business venture the owners of which desire to succeed and prosper. The crushing of coal may be made profitable, however, and in my opinion is a necessity at many mines.

Coal Preparation in the Rocky Mountain Field

By Benedict Shubart*

SYNOPSIS—A district where the production of lump coal is the chief requirement. Box-car loaders are employed. Details of rescreening and washing methods.

In no section of the United States is the preparation of coal more elaborate than in the Rocky Mountain district. An Eastern operator entering this territory will almost always commence with a criticism of the seemingly ridiculous care that is taken both in the handling and the screening of the mine product, but a brief study of the market conditions will show why all this care is necessary and profitable.

With the exception of three or four months in the fall, there is practically no demand for steam coal. During the months of September, October, November and December, the sugar factories absorb a considerable amount of slack coal, the amount used by each factory being substantially the slack resultant from a production of 400 tons of coal per day. Thus one mine can serve practically two factories or even more.

This forms the largest single market for slack coal. Aside from this, there is a comparatively slight demand. The Rocky Mountain country is not yet a manufacturing district; and besides, the water-power resources have been developed to a high degree, and many small factories are driven by electricity derived from water power.

It is clear that there must be an overproduction of slack coal which must be disposed of at an expense additional to the cost of mining; furthermore, the sale of this slack tends to lower the price of the fine coal which ordinarily has a market.

Mine of the Big Horn Collieries Co. at Crosby, Wyo.

Demand Is for Large Coal

The Rocky Mountain West is a country of long distances. California is quite a way from Colorado, Utah and New Mexico, whence it gets its coal. The long grind to market in railroad cars causes a considerable breakage in the coal. With a freight rate varying from $4 to $6 per ton over the long hauls, and substantially no market for the fine coal which must be screened out before the large coal can be sold, the reason for the demand for a perfectly prepared large coal is plain.

The domestic market refuses to take any but the largest coal. Lumps of coal weighing from 150 to 300 lb. are frequently shipped, and the cry from the consumer is always for larger coal.

Starting in the mines, the question of the economy of shooting off the solid has been settled by the slack question. Small coal cannot be sold, and furthermore costs money to dispose of, so the coal must be undercut or sheared to increase the percentage of lump and nut coal. This unquestionably makes for safety in the mines by decreasing the amount of powder used, minimizing the windy shots and preventing to a large extent the shattering of the roof.

Of course in the coking-coal districts around Trinidad, Raton and Dawson, the slack can be made into coke, and furthermore makes a very good steam coal, so that in this district the slack question is not so important. The preparation of the other coal, however, is the same as in the rest of the Rocky Mountain district.

---

Robinson Tipple of Colorado Fuel & Iron Co. at Walsenburg, Colo.

No. 4 Tipple of the Kemmerer Coal Co. at Kemmerer, Wyo.

Plant of Carney Coal Co., Carneyville, Wyo

Every care is taken on the tipple to prevent breakage. Most of the modern tipples are now installing the power-driven type of rotary dump, not only because this permits the use of a solid-end car, which is safer and more economical than the old-style cars, but because it provides a method of dumping with the least possible amount of breakage. Gravity screens are used only in the smallest of wagon mines. Practically every modern tipple is equipped with shaking screens of some variety, and there are one or two installations of Marcus screens. Some of these installations are equipped for making quickly and easily the widest variety of sizes.

In the Utah field substantially 12 different grades are required, as follows: Run-of-mine coal, lump coal over 1½-in. perforations, lump coal over 3-in., lump coal over 5 in., lump coal over 8-in., slack coal through 1½-in., pea coal through 1½-in. and over ½-in., dust through ½-in., nut coal through 3-in. and over 1½-in., egg coal through 5-in. and over 3-in., stove coal through 5-in. and over 1½-in., California lump coal through 8-in. and over 3-in. These are roughly the sizes of coal demanded by the trade, the size of the perforations varying at different mines.

Rescreening Plants

Of course all these sizes are not made on the shaking screens. Each plant is supplemented by a rescreening plant, with its elevators, screens, and bins for storage. In some instances only the slack coal is raised for rescreening, in others the nut and slack coal, and in some instances even the egg, nut and slack coal. For this work in the larger mines the very rugged continuous-bucket elevator mounted on double strands of steel rolling chain is used, the type being shown by the accompanying illustration.

For the greater part, rotary screens are used, and they do very good work excepting in the case of damp coal,

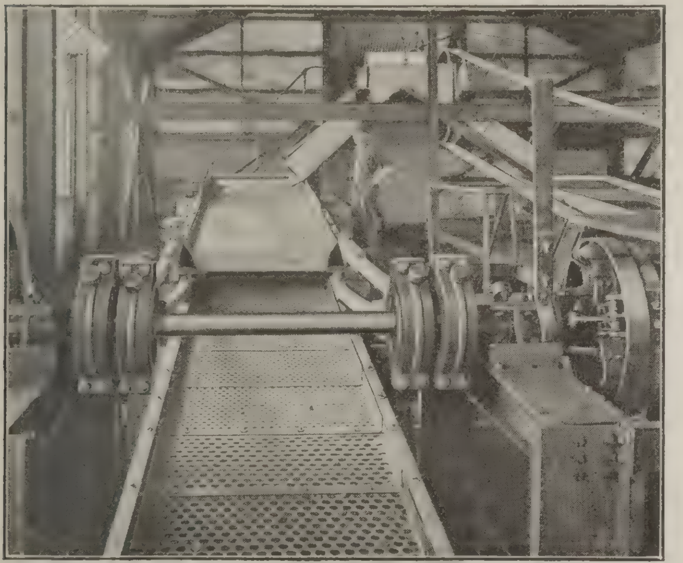
Tipple of Oakdale Coal Co., Oakview, Colo.

Tipple of Roundup (Mont.) Coal Mining Co.

where it is exceedingly difficult to keep the small perforations clear. These screens vary in size from 4 ft. in diameter by 12 ft. long to 5 ft. in diameter by 20 ft. long, and in some mines as many as four of the latter are installed to secure efficient screening.

Some recent installations use the Parrish screen. This is a shaker screen of peculiar design, the frame consisting of hickory or ash rigidly attached to elastic hangers or supports. The eccentric rods are also rigidly attached to the screen, the resulting motion being a sort of a whipping action, which tends to break up the masses of coal and to keep the screens clear.

A further complication in the preparation of coal in this district is the necessity for loading box-cars. Lump coal is invariably loaded into box-cars over the greater part of the territory. The same applies to nut coal, and it is even necessary in some cases to load coal as small as pea coal into box-cars. The reason for this is twofold—firstly the inability of the railroad company to supply sufficient coal cars and secondly the long hauls. The trains are obliged to stop at a good many division points before reaching their destination, and each division point takes its toll in the way of stolen coal, the total shrinkage being considerable.



A Shaking Screen Installation in the Rocky Mountain Field

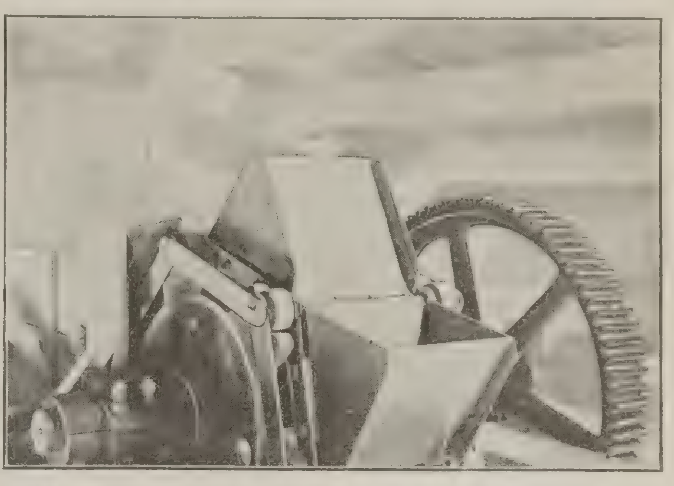
For easing the coal gently into the cars some very elaborate chutes are used. At the end of the shaking screen is usually a swinging shaking chute, which may be raised or lowered to adjust it to the height of the different cars, or else a picking-table type of conveyor is installed, pivoted at one end so that it can be adjusted for height.

Box-Car Loaders Are Used

Of course, box-car loaders are a necessity where the mine tonnage is of any moment. The Victor, Christy and Ottumwa loaders are all in use in the West, and the Manierre loader, which promises to handle the coal much more gently than any previous loader, is rapidly coming into use. Loaders are frequently installed in the larger mines for loading nut coal.

Few tipples are built with less than four loading tracks, and most of the tipples have five. This makes a very long tipple structure and necessitates carrying the coal a considerable distance before the final product is discharged into the farthest car.

Picking coal is not extensively practiced in the West. There are a few picking tables installed, but the picking is not nearly so thorough as in the Eastern mines. The infrequency of picking may be partly accounted for by the fact that there is so much thick and clean Western coal easily at hand that the dirtier seams have not yet been opened up.



Head of Elevator at Plant of Panther Coal Co., Panther, Utah

Many of the Western operators feel, too, that picking is only a makeshift, and where it is essential that rock be cleaned from the coal, the installation of a small washer has proven much more satisfactory and more economical in operation than the maintenance of picking tables.

Steel construction for tipples has not yet taken hold in the West very firmly. Several steel tipples have been constructed, and several more are in the process of construction. The trend of the mining law is to prevent the installation of inflammable structures near the mine mouth, and legislation in some of the Rocky Mountain States, together with threatened legislation in others, is proving a great factor in the design of tipples.

※

Mining Companies Purchase New Equipment

A great many people recently have contended that business of all kinds is very bad. There are those, however, who take a different view and who state that conditions in their particular line are fairly prosperous. We have all heard that the coke business is improving rapidly, and it is interesting to know, also, that bituminous operators in many states have taken an optimistic stand and are preparing for an active trade this coming fall.

The Roberts & Schaefer Co., of Chicago, has received orders during the past six weeks for more than $300,000 worth of tipple and mine construction work. The prospective purchasers of this equipment are: Harty Coal Co., Mullens, W. Va.; Cottonwood Coal Co., Stockett, Mont.; Oregon-Washington R.R. & Navigation Co., Seattle, Wash.; Ayrshire Coal Co., Oakland City, Ind.; Oliphant-Wasson Coal Co., Vincennes, Ind.; Lorain Coal & Dock Co., Columbus, Ohio; Louisville & Nashville R.R. Co., Louisville, Ky.; Carter Coal Co., Coalwood, W. Va.; Elkins Coal & Coke Co., Morgantown, W. Va.

Eastern Ohio Mining Scale

SYNOPSIS—The agreement between the Association of Pittsburgh Vein Operators of Ohio and the United Mine Workers of America with reference to the operation of their mines in Belmont, Harrison and Jefferson Counties, Ohio. This agreement went into effect May 11, 1915, and will expire Mar. 31, 1916.

Following are the rules and regulations of the eastern Ohio scale somewhat condensed:

Rule 1. It is agreed that all local rules, regulations and customs heretofore established in conflict with this agreement are hereby abolished.

Rule 2. The management of the mine, the direction of the working force and the right to hire and discharge are vested exclusively in the operator, and the U. M. W. of A. shall not abridge these rights. It is not the intention of this provision to discourage the discharge of employees, or the refusal of employment to applicants because of personal prejudices or activity in matters affecting the U. M. W. of A. If any employee shall be suspended or discharged by the operator, and it is claimed that an injustice has been done, an investigation shall be made promptly by the mine committee and the mine superintendent, and if they fail to agree, the dispute shall be referred to the operator affected and the officers of District No. 6 or their representatives.

If the finding is that the said employee was wrongfully discharged or suspended the company then shall reinstate him and pay full compensation for the time lost through such suspension, based on the earnings of the said employee prior to his being discharged or suspended.

[The provisions of this rule contradict one another and may be the cause of much trouble later.—Editor.]

HOURS OF LABOR

Rule 3. The 8-hr. day of 48 hr. per week as provided in the Columbus day-wage scale of 1898 is hereby reaffirmed. The following holidays are recognized: Sundays, New Year's, Washington's Birthday, Apr. 1, Decoration Day, Fourth of July, Labor Day, Thanksgiving Day, Christmas.

(a) An 8-hr. day means 8-hr. work in the mines at usual working-places and includes all classes of labor. This shall be exclusive of the time necessarily expended in reaching such working-places in the morning and in departing from the same in the evening. The drivers shall take their mules from the stable to the passway where they receive the car from the motor and return the same in like manner to the stable. Motormen and tripriders shall be at the passway where they receive empty cars at starting time, and the time necessarily expended in taking mules and motors to the passway in the morning and returning the same at night shall not include any part of the day's labor, the working day of these men beginning when they reach the change or parting at which they receive empty cars, and in no case shall their time be docked when waiting for cars at the point named.

(b) All employees must be at their working-places at starting time on all days that the mines operate and shall remain there full 8 hr. or during such part of the 8 hr. as they have work to perform.

(c) Work shall begin at 7 a.m. and continue till 11 a.m. Not more than 30 min. shall be taken for dinner, and work will recommence at 11:30 a.m. and be concluded at 3:30 p.m. Central standard time. (This rule may be modified by mutual consent.

(d) When any places on any territory are not cut and the machine runners have not worked as many hours as the mine has been operated, by reason of breakdowns, sickness or absence of runners, the machine runners shall work on idle days or overtime until they have made up the time lost.

DISCIPLINE

Rule 4. No strike shall occur at any mine, except for failure to pay on the regular payday, without explanation.

(a) Should any officer or officers of the U. M. W. of A. or any member or members thereof, employed at any time, cause the mine or part of the mine to be shut down in violation of this rule, each member of the United Mine Workers of America employed at said mine who does not continue at work shall have deducted from his earnings $1 per day for each day or part of a day he remains idle.

(b) Should any operator or his representative lock the men out for the purpose of forcing a settlement of any grievance or cause the mine or a part of the mine to shut down in violation of this rule, he shall be fined $1 per employee for each day or part of a day during which the mine is thus thrown idle.

(c) All moneys assessed against employees under this rule shall be collected from the pay for the half-month in which the violation of the rule occurs or from the first money due thereafter. All moneys assessed against the operator for violation of this rule shall be turned over to subdistrict No. 5 of the U. M. W. of A., and all moneys assessed against the miners shall be turned over to the Association of Pittsburgh Vein Operators of Ohio.

(d) In any local grievance arising at any mine the aggrieved party or parties and mine foreman shall first make an earnest effort to adjust the dispute. Should they fail to agree, the question in dispute shall be referred to the mine foreman or superintendent and the mine committee. If these then fail to agree, it shall be referred to the general manager of the company involved, or his representative, and the president of the subdistrict organization, or his representative.

Should they also fail to arrive at a settlement, the matter shall then be referred to the president of District No. 6, United Mine Workers of America, or his representative, and the representative of the A. of P. V. O. of O. If they fail to agree, the matter shall be referred to the executive board of District No. 6 and the A. of P. V. O. of O. Should they fail to settle the controversy, the matter shall then be submitted to arbitration for final disposition. The miners' representative on this board of arbitration shall be the president of subdistrict No. 5. The operators' representative shall be the commissioner of the A. of P. V. O. of O. The third member shall be selected at once by the executive board to which reference is made above. Should they fail to make a selection within one day, then the third member of the board shall be appointed by the Industrial Commission of the State of Ohio, and if for any reason it is unable to make such selection, the federal judge of the northern district of Ohio shall then appoint such third member of the arbitration board.

The matter in controversy shall be immediately taken up by this board, and a decision of a majority shall be final and binding on both parties to the controversy. The expense of the arbitration shall be borne by the party against which the decision is rendered.

Rule 5. When any employee absents himself from duty two days or more, except on account of sickness, without giving advance notice, when possible, to the mine boss or mine superintendent, he forfeits his position.

Rule 6. When a machine runner or any employee upon whose work other employees of the mine are dependent absents himself from duty without giving advance notice, when possible, to the mine boss, he forfeits his position.

Rule 7. The pit committee shall consist of not more than three members, one or more of whom must be able to speak the English language. They, like all other employees, shall remain at their working-places unless a miner and a mine boss fail to agree on prices to be paid for extra work, when they may be called in to confer with the mine boss or superintendent in deciding the dispute.

Rule 8. No meeting shall be held during working hours except by mutual agreement between miners and superintendent.

PREPARATION OF COAL

Rule 9. Both miners and operators realize that in order to insure the sale of coal it is important that it should be clean. Consequently, it is mutually agreed that the miners will produce their coal in such a manner as will not increase, either by carelessness or reckless shooting, the percentage of fine coal, and will load the coal free from impurities.

In order to insure the above results, it is agreed as follows:

(a) Before shooting, all coal must be snubbed by the miner, if the operator so requires, and the fine coal and cuttings thoroughly cleaned from under the cut. The snubbing shall be 10 in. above the cut and 3 ft. under the coal.

(b) The miner or loader shall not drill his hole on the solid nor deeper than the undercut.

(c) Unless otherwise required by the operator, the fine coal and cuttings must not be loaded out separately, but must be loaded and distributed throughout the balance of the coal, in order to keep the product of the mine uniform.

(d) Any miner or loader who is found breaking up and loading the band or other impurities with his coal shall be fined $1 for each offense or be discharged, the penalty being at the option of the operator.

(e) The operator may designate one man at each mine who shall be recognized as inspector and whose duty it shall be to inspect and clean the coal. In case slate, bone, bands, copper stone or other impurities are sent out by the miner, the inspector selected shall estimate or weigh the quantity of the impurities, and the weight thereof shall be deducted from the total weight of the contents of the car and the miner or loader sending out the impurities shall be notified.

For the second offense within any pay, he shall be fined 50c. in addition to docking. For the third and each subsequent offense within any pay the miner shall be fined $1 in addition to docking, or he may be suspended or discharged at the option of the operator. A record of all cases and a daily report thereof shall be made to the operator and local union, giving the names of the parties loading impurities, with their check numbers.

Any employee of any mine abusing or seeking to embarrass the inspector for performing his duty shall be fined $3 or discharged at the option of the superintendent. Any local union where the miners so desire may select and employ one of its members who shall act jointly with the coal inspector appointed by the operator. This clause shall be so applied that no loaders or miners shall be unjustly or unreasonably penalized thereunder.

All fines imposed under the clean-coal rule shall be collected by the operator and turned over to the president of subdistrict No. 5 and the operators' commissioner, and shall be deposited in some bank to the joint credit of both. Such deposits are to serve from time to time as a burial fund or for other like charitable purposes as may be agreed upon.

DEAD-WORK PRICES

Rule 10. Operators shall pay 25c. per yard extra for driving wet entries when the miner and the mine boss agree that the place is entitled to that classification. The mine committee and the mine superintendent shall decide the matter if the former cannot agree.

(a) Operators shall take the water out of rooms and entries and have them dry at starting time, or pay 5c. per barrel if the miner has to bail the water. Barrels shall be placed in rooms and entries, and in those entries where they cannot be placed, the water-box shall be forwarded for the entrymen to bail water in.

Rule 11. Any rolls or horsebacks coming up in the bottom or down in the top shall be paid for as follows, per yard, running with the roll:

	Cutter	Loader
From 6 to 10 in. thick	$0.00	$0.31
Between 10 and 17 in.	.10	.52
Between 17 and 23 in.	.23	.85
Between 23 and 29 in.	.36	1.08

Any rolls of greater thickness shall be paid for in the same proportion for each 6 in. Miners shall take up and remove rolls where they cross the roadway.

When the roll is so hard as to require drilling and blasting, the operator shall furnish one-half and the miner one-half the labor for drilling and blasting. No part of the compensation shall go to the cutter for rolls coming down from the top.

Rule 12. When entries and entry breakthroughs in pick and machine mines are driven double shift, 25c. extra per yard shall be paid.

Rule 13. In order to prevent falls, miners shall exercise proper care in posting soapstone in rooms. When coal is taken out by the person employed in a room and less than 750 lb. of soapstone falls, it shall be removed by the miner without compensation. When the fall of soapstone exceeds 750 lb., the miner shall be paid for removing it unless it is removed by the company. The miner shall be entitled to compensation only in case the room has been properly posted.

(a) The prices to be paid for slate or soapstone unavoidably coming down over the coal shall be agreed upon by the mine boss and the miner. If they fail to agree, the dispute shall be referred to the superintendent, mine boss and mine committee.

(b) Clay veins and spars shall be paid for, the amount being determined by the miner affected and the mine boss. If the latter fail to agree, the company reserves the right to remove the vein or spar and give the miner another place.

Rule 14. Machinemen in both wide and narrow work are required to cut the coal level and close to the bottom, and in no case shall the thickness of bottom coal left exceed 4 in. If a machine cutter leaves a sprag or bottom coal over 4 in. thick he shall be notified to remove it, and should he fail or refuse, he shall be charged 50c. for each sprag or 25c. for each run or both, the penalty being paid to the loader.

Bottom coal in all narrow work must be taken up and loaded by the loader if the operator so requires. Bottom coal must be left down if the operator so orders.

Bottom coal in wide rooms which does not exceed 4 in. in thickness and is not "sticky" shall be lifted by the miner without extra compensation.

Whether the coal is or is not "sticky" shall be determined by the mine boss and loader in the following manner: The bottom is to be sheared along the rib to the face, and is to be open on the end. Two wedges are to be driven through the bottom coal, these wedges being 18 and 36 in. from the shearing and to reach 18 in. from the front of the bottom coal. If the coal still clings and adheres to the floor, it shall be termed "sticky bottom," and the loader shall not be required to lift it without compensation based on the maximum inside day-wage scale.

This, however, shall not prevent the mine boss and loader from making a mutual agreement to lift the bottom, or in case of their failure, to agree to have it lifted by anyone by paying the maximum inside day-wage scale. Nor shall it prevent the mine committee and superintendent from making investigations in case of disagreement under the above rule.

Rule 15. No extra compensation shall be paid because a working-place is driven on the butts or faces or at any angle thereto.

Rule 16. The operators pledge themselves to provide two rooms for each two machine loaders at the earliest possible moment, but in the event of territory becoming scarce through a squeeze or striking a horseback or any unavoidable obstacle, this rule shall not be construed so as to diminish the output of the mine.

(a) With 18-ft. rooms and a track along the rib, the above rule shall be modified by the operators and miners affected, if under its application the loaders will not be as steadily employed as they are at present under this rule. It shall be provided, however, that no two men be forced to work in one room.

Rule 17. All men driving working-places 15 ft. wide or over shall receive the tonnage price only, except in such rooms as hereinafter provided.

Rule 18. All rooms shall be 18 ft. wide or over. The operator shall designate the width of the room. When it is ordered that the place be driven less than 18 ft. wide, entry price shall be paid.

Rule 19. When required by the operator, rooms may be turned by machine, thus eliminating pickwork. In case the operator requires that pick cuts be taken out, the prices provided for herein shall be paid.

Rule 20. When the day men go into the mine in the morning, they shall be entitled to two hours' pay whether or not the mine works the full two hours. But after the first two hours the day men shall be paid for every hour thereafter by the hour for each hour's work or fractional part thereof. If for any reason the regular routine work cannot be furnished to the inside labor for a portion of the first two hours, the operators may furnish other than the regular labor for the unexpired time.

Rule 21. Any man called from the inside of the mine to perform outside day labor temporarily shall receive inside day wages. Any man called from the face of the coal or who receives $2.84 per day shall be paid that same sum.

Any miner who is without coal and who accepts employment on the outside for that day or any fractional part thereof shall receive the outside day wages for the class of work he performs.

Rule 22. A uniform rate of 1 per cent. on the dollar shall be charged in pick mines where the company hires the blacksmith, and it is further agreed that no cutters and loaders in machine mines shall be charged for blacksmithing.

MISCELLANEOUS RULES

Rule 23. There shall be no free turns allowed for either rooms or entries. The entries shall be driven as fast as the operators desire or conditions permit; but in no case shall entry miners be allowed more cars for coal than room miners, and at least once each pay the turn shall be made uniform throughout the mine for the time previously worked. If, however, the regular turn will not allow cars enough to drive the entries as fast as desired, the operators shall increase the number of miners in each entry, so that by giving to each the regular turn the entries shall be driven as fast as two miners could drive them with an unlimited supply of cars.

If, however, the room men decline to take their place in the entries when requested by the operator, then the entrymen shall have free turns until the entries are driven their required length.

Rule 24. A checkweighman may be placed on the tipple at the expense of the miners. He must not be a member of the pit committee and must at the time of his selection be an employee at the mine where he is to serve. His duties shall be those prescribed by the laws of the State of Ohio. All weigh scales may be tested by the miners at any reasonable time.

Rule 25. Any rule, either local or general, governing the scale or conditions of employment in the Pittsburgh vein of subdistrict No. 5 shall be mutually agreed to by the operators and miners interested, and said rules, before being enforced, shall receive the indorsement of the officials both of the operators and of District No. 6, U. M. W. of A.

Rule 26. The miners may cease working only on the day on which a fatal accident to an employee occurs in the mine. Under no circumstances shall the mine be made idle for any funeral.

In consideration of the mine continuing to work on the day a funeral is held, the operators agree to contribute to the bereaved family, on the death of any of their employees, one-third of the amount paid by the miners, said amount not to exceed $25. This rule does not prevent friends from attending a funeral. The operators shall not be required to pay the amount herein specified in case the deceased was covered by the Workmen's Compensation Act.

Rule 27. In case of local or general suspension of mining, either at the expiration of this contract or otherwise, the engineers, firemen, pumpers and other men necessary to keep the mines in shape shall not suspend work, but shall, when work is suspended, fully protect and keep in repair all the company's property under their care, and operate the fans and pumps, and lower and hoist such men or supplies as may be required to keep up steam at the company's coal plant; but it is understood and agreed that the operators will not ask them to hoist for sale on the market any coal produced by nonunion labor. The rates to be paid for such work to be those in effect at the time of suspension and also subject to any subsequent settlement.

Rule 28. The conditions, employment, duties, hours of labor and membership of the U. M. W. of A. of the engineers, firemen, electricians and machinists existing prior to Sept. 1, 1903, continue and remain in force during the life of this contract.

It is further agreed that if any member of the U. M. W. of A., even if on a mine committee or serving as a local officer, shall interfere with the engineers, firemen, electricians or machinists on duty he shall be subject to suspension or dismissal by the operator, it being understood that the engineers, firemen, electricians or machinists who are now members shall remain members of the U. M. W. of A. and those who are not members shall not be compelled to join.

Rule 29. Pay days shall be on the 10th and 25th of each month.

Rule 30. The check-off system is adopted as a part of the agreement in this district. This rule pertains to regular dues and assessments of the U. M. W. of A. In order to be honored the check-off must be furnished to the company not later than 5 p.m. on the 2d and 17th day of each month.

Rule 31. Where railroad cars are promised and are on the way between the yards and the mines at starting time in the morning, the men shall wait 30 min. and no more; provided, however, that where satisfactory local arrangements exist regulating the waiting for cars, the same shall remain in force.

Rule 32. The prices herein stipulated for cutting and loading a ton of coal carry with them compensation for taking care of the working-places. When the conditions of the working-places are such that it becomes necessary to reset posts, it shall be done by the cutter on one of the two following bases:

(1) The cutter shall reset two posts in rooms of any width without extra compensation and he shall receive 3c. per post for each additional post reset, or (2) the cutter shall reset three posts in a 24-ft. working-place or two posts in an 18-ft. working-place, without any extra compensation, and for each additional post reset in excess thereof he shall receive 5c. per post. Posts in either case shall be counted but once.

The operator shall have the right to elect which basis of settlement is to govern work of this character, if any, at each individual mine, but having made his decision he is not permitted to change the basis during the life of this contract. If posts need resetting the machine runner shall, if possible, notify the mine boss in advance that such work is necessary.

Rule 33. It is understood and agreed that should any dispute arise in regard to the interpretation of the rules and provisions of this scale the interpretation shall be left entirely to the committee of operators and miners who formulated and signed this agreement.

Rule 34. All draw-slate over 12 in. thick shall be considered "thick slate" and shall be paid for on the following basis per yard, running with the working-places:

The rate for each inch of draw-slate over 12-in. shall be $0.063 for a room 24 ft. wide, $0.053 for a room 18 ft. wide, $0.048 for a room 15 ft. wide, $0.042 for an entry 12 ft. wide and $0.0315 for an entry 8 ft. wide.

PICK-MINING SCALE

Mining, run-of-mine coal, per ton	$0.676
Mining, bank measure, per foot, room 24 ft. wide, coal 5 ft. thick	3.22
Mining, bank measure, entries not to exceed 6 ft. wide, per yard	4.06
Mining, bank measure, entries not to exceed 7 ft. wide per yard	4.74
Mining, bank measure, entries not to exceed 8 ft. wide, per yard	5.41

For every 3 in. above or below the regular height of 5 ft. of coal on a bank-measure system, in both entries and rooms, a proportionate advance or decline in the mining rate shall be paid.

INSIDE DAY-WAGE SCALE

Tracklayers, bottom cagers, drivers, motormen, trip-riders, machine-haulers, water-haulers and timbermen, where the latter are employed, per day	$2.84
Pipemen for compressed-air plants, per day	2.78
Tracklayer's helpers, and all other inside day labor, per day	2.62
Trappers, per day	1.25

OUTSIDE DAY-WAGE SCALE

The following shall be the scale for outside day labor, as enumerated below:

Checkers, per day	$2.51
Dumpers, per day	2.34
Trimmers, per day	2.19
First blacksmith, per day	3.12
Second blacksmith, per day	2.81
Blacksmith's helpers, per day	2.62
Mine carpenters, per day	2.62
Couplers and greasers, per day (boys)	1.37

All present outside day labor not satisfied with the wages to be paid according to this scale shall be given an average place in the mine.

The above schedule of day wages applies only to men employed in the performance of their labor and does not apply to boys, unless they can do and are employed to do a man's work.

MACHINE-MINING SCALE

Chain Machines

Cutting in rooms, per ton	$0.08
Cutting in entries, breakthroughs between entries, breakthroughs between rooms, and turning rooms 8 ft. wide, per ton	.08
And extra per yard	.20
Cutting in entries, breakthroughs between entries, breakthroughs between rooms and turning rooms, 12 ft. wide, per ton	.08
And extra per yard	.15
Loading with hand drilling in rooms, per ton	.39
Loading with hand drilling in entries, breakthroughs between entries, breakthroughs between rooms and turning rooms, 8 ft. wide, per ton	.39
And extra per yard	.50
Loading with hand drilling in entries, breakthroughs between entries, breakthroughs between rooms and turning rooms, 12 ft. wide, per ton	.39
And extra per yard	.40

Pick Cutting

Pick cutting, 8 ft. wide, per ton	$0.39
And extra per yard	2.90
Pick cutting, 12 ft. wide, per ton	.39
And extra per yard	3.62

Drilling—After both chain and punching machines, where drilling is done by machine operated by other than the loader, 1.85c. per ton mine-run coal will be paid to the driller and 2.27c. deducted from the price for loading as above.

Classifying Technical Literature

Delegates from about twenty national technical and scientific societies met in the United Engineering Societies Building, 29 West 39th St., New York City, on May 21, 1915, to perfect a permanent organization, the purpose being to prepare a classification of the literature of applied science which might be generally accepted and adopted by these and other organizations.

The name adopted for this organization is Joint Committee on Classification of Technical Literature, and the temporary address of the secretary, W. P. Cutter, is 29 West 39th St., New York City. Fred R. Low, the editor of *Power*, is chairman of the committee.

Tipple Equipment for a Modest Tonnage

By E. C. De Wolfe*

SYNOPSIS—The coal is lowered down the mountain side by an inclined plane to the tipple, where careful preparation is secured. The entire equipment was designed to handle a normal output of 200 tons per hour.

In the comparatively new fields of Harlan County, Kentucky, the Golden Ash Coal Co. has recently opened a mine to win a high-grade fuel from a high-level seam in the mountains. The plant is modest in character, as befitting the limited extent of the property. The tipple is placed at railroad elevation, while an incline leads up the mountainside to the level of the mine proper.

The tipple, Fig. 2, is a frame structure, equipped with a complete outfit of machinery, made by the Webster Manufacturing Co., Tiffin, Ohio, from the mine-car weigh scales to the railroad-car loading chutes. The equipment is designed throughout to handle an output of 200 tons per hour. While small and simple, it is complete and of the highest quality.

Mine cars in trips of four are let down the incline behind "dolly" cars. Uncoupled on the level approach to the tipple the cars are run singly over the scales and thence to the crossover dump, where the coal is discharged into the hopper the bottom of which is seen in Fig. 3.

A reciprocating feeder beneath the hopper delivers the coal evenly to the pair of balanced, inclined shaker screens, Fig. 4. On the day of the photographer's visit the output was being loaded as mine run, so the screens were veiled, as shown by Fig. 5, and cars were passed beneath the tipple on one track only, Fig. 2.

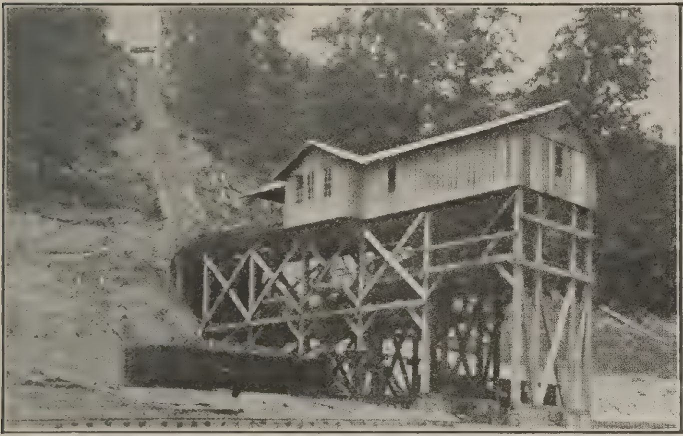


Fig. 1. Tipple and Gravity Plane of the Golden Ash Coal Co.

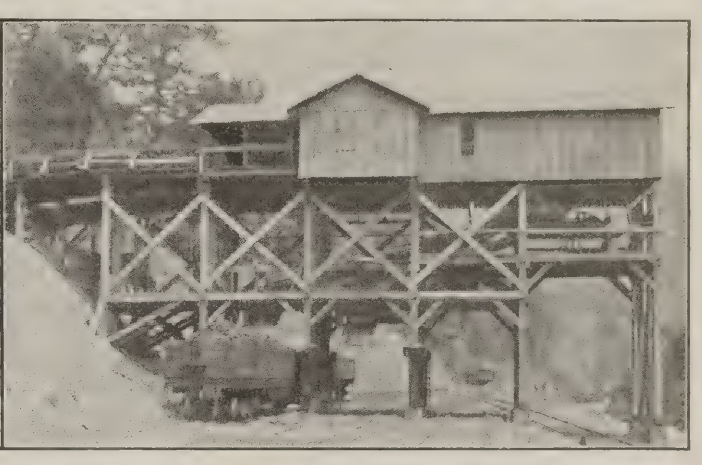

Fig. 2. The Tipple Spanning Four Loading Tracks

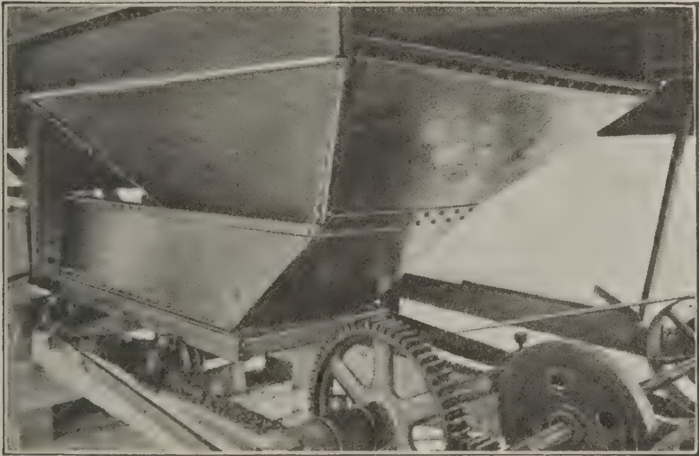

Fig. 3. Receiving Hopper and Reciprocating Feeder to Screens

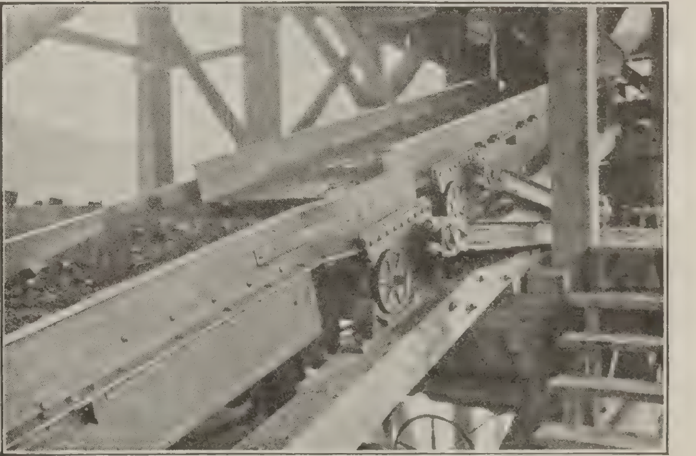

Fig. 4. Shaker Screens and Operating Connections

The two shakers are operated in balance by oppositely working eccentrics, the screens being mounted on wheels supported for a short horizontal movement.

For each grade of coal prepared there is a steel loading chute set permanently at proper inclination and adjustable to the desired loading position by movement endwise. This arrangement maintains a constant pitch to the chute and is therefore preferable to the common method of hing-

---

*Secretary-treasurer, Russell-De Wolfe Co., 537 South Dearborn St., Chicago, Ill.

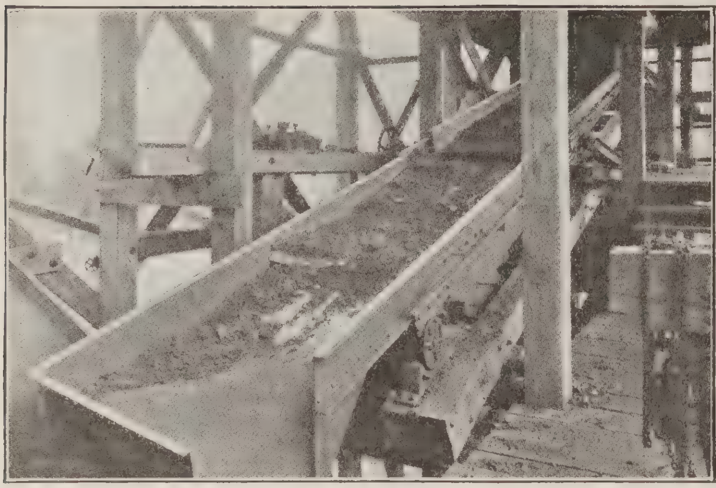

Fig. 5. Screens Veiled for Loading Run-of-Mine Direct to Railroad Cars

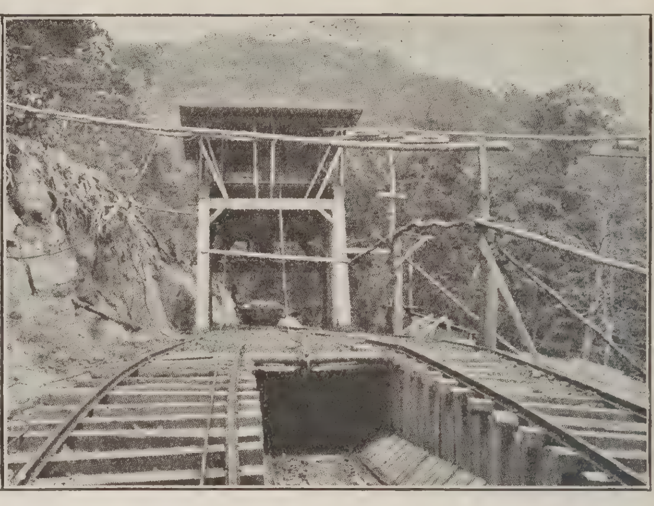

Fig. 6. Load Tracks over the Knuckle, and Empty Return Between

ing at the upper end and making loading adjustments by raising and lowering the delivery end.

The endwise adjustment is effected simply by arranging the chutes to slide in suitable guides, under control of a wire rope carried to a hand winch placed for convenient operation by the man on the loading runway beneath the tipple. At the left in Fig. 5 may be seen a portion of the lump or mine-run chute, and beyond it the wire rope passing over a sheave giving a fair lead to the winch below.

Operation of the Gravity Plane

At the head of the incline in a heavily timbered frame, Figs. 6, 7 and 8, is the rope drum by which the operation of the gravity plane is controlled. On the double tracks down the mountain the loaded cars going down haul the empties up. The drum has therefore only controlling work to do, and its principal feature is a positive and safe brake of ample power for all emergencies.

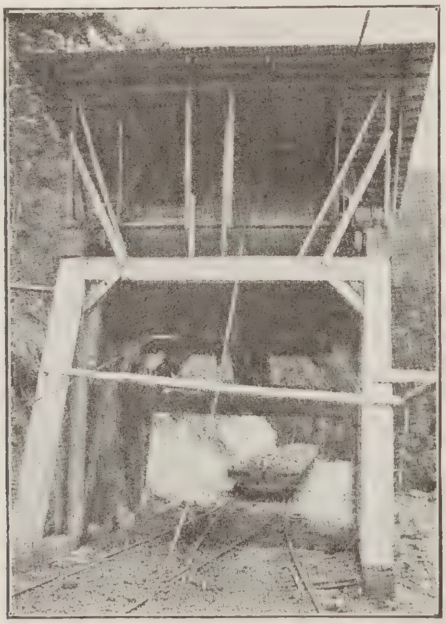

Fig. 7. Drum and Supporting Structure

The drum at Golden Ash has two heavy band brakes, one at each end. Either is ample for stopping and holding the drum at any speed it might attain, with any load which might be going down and with no load going up on the other rope. The drum is 8 ft. in diameter and 9 ft. long. It is of wood, on cast-iron spiders, fitted to a large shaft, supported in heavy rigid pillow blocks.

As shown in Fig. 7, the loaded cars may be sent through beneath the drum on either of two tracks leading to the "knuckle" at the head of the incline. Sets of four cars coupled together are alternately sent over these two tracks for lowering to the tipple. On whichever track the empties come up, they are switched automatically to a central track, on which they pass through the tunnel and run out to the right onto a side track, where they are made up into trips for return to the mine.

Sloping sides beside the rails in the tunnel and its approach force the cars back onto the track in case they should for any cause be derailed in coming up the incline. This is a wise and simple provision for safety and surety of operation where light empties are handled under conditions tending naturally to danger of derailment.

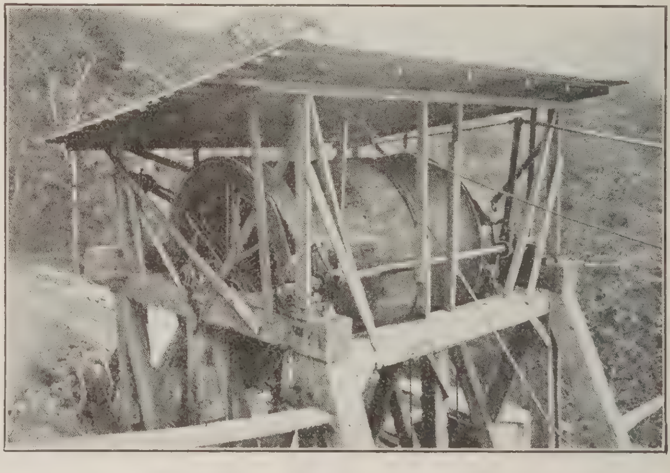

Fig. 8. The Drum and Its Powerful Double Brakes

⁂

Tennessee Wage Law Invalid—The law enacted by the Tennessee Legislature in 1913 making it an offense for a corporation which operates a commissary to refuse to make semimonthly payment of wages to its employees in cash, after deducting amounts due for advancements, is invalid as indirectly authorizing imprisonment for debt, in violation of the constitution of that state. (Tennessee Supreme Court, State vs. Prudential Coal Co., 170 Southwestern Reporter 56.)

Utilizing Anthracite Dust

By J. C. Law*

SYNOPSIS—About one million tons of anthracite coal too fine to be marketable is produced yearly. Thus far attempts at briquetting this material have not been pronounced commercial successes. Coal-tar pitch has been heretofore used as a binder, but experiments would indicate that sulphite pitch with a few other ingredients added is a much better material for this purpose.

As a preface to this contribution bearing on the conservation of anthracite coal, I am reminded of a paragraph pertinent to the subject appearing in an editorial in Coal Age of Apr. 17, reading as follows:

"The American coal operator of today is a thorough economist. . . . In our present stage of development along economic lines no one would venture the assertion that the utmost attainable has been reached."

The writer is in full accord with this view, but will confine discussion to the anthracite branch of the industry. It would seem that wherein anthracite coal mining and conservation in extraction are concerned the operators have, under modern methods, attained the utmost. Yet in this branch of the industry there is a final stage in the employment of a present unmerchantable anthracite product that has not been reached, and so far has practically failed as an economic proposition, but which can be profitably utilized.

The matter referred to is the commercially successful utilization of the present huge cumulative tonnage of coal dust or anthracite fines below No. 3 buckwheat. Down to that size the coal is both salable and usable, alone in some instances, but more generally in combination with No. 1 or No. 2 buckwheat. The great tonnage below these sizes, which is now screened off and conserved, is practically pure coal chippings, but its profitable disposal is a grave problem at the majority of operations.

This finer product, aside from that already in banks unmixed with culm and other refuse, amounts to fully 1 per cent. of the total production of about 90,000,000 tons annually. On the face of it this appears to be an insignificant amount, yet in cold figures it aggregates 900,000 tons, of a nominal market value of 30c. to 35c. per ton f.o.b. It is possible that this tonnage is underestimated. Lackawanna County alone is officially reported to have produced over 320,000 tons of what is termed No. 4 buckwheat and under in the last 6 months of 1914. Actual tonnages of No. 4 buckwheat and below are difficult to obtain, for the reason that most collieries make no differential in reporting their tonnages below No. 3 buckwheat. It would be safe to assume, however, that 1,000,000 tons of these practically unsalable fines is produced annually.

A Solution Formulated

What, then, is the solution of this problem? Is there no way this product can be profitably capitalized? Eighteen months' special investigation of the subject convinces the writer that it *can* be, and the following is presented as a logical solution:

Primarily, let it be said that for many years private capital in the main has endeavored to briquette this material for domestic use. The briquetting plants have been operated within and without the coal field, using mainly coal-tar pitch as a binder. It is now an established fact that anthracite and coal-tar binder will not produce a satisfactory and smokeless briquette for domestic use, and this only should be the aim of any anthracite briquetting company—not alone to make a smokeless briquette, but one that is odorless and waterproof. The latter feature is not absolutely essential, but it is preferable, and adds but a few cents per ton additional to the cost of the process.

The demand for briquettes of anthracite is like that for the majority tonnage of fresh-mined hard coal and is confined to a comparatively limited market. That market is Pennsylvania, New York, New Jersey, Delaware and the New England States, which consume 82 per cent. of the entire anthracite production. In these states the consumer is accustomed to the use of anthracite coal for domestic purposes in stove, furnace and fireplace, and nothing short of a smokeless, odorless fuel will be tolerated if the cost of domestic sizes of hard coal to the consumer is not materially advanced in future years.

The heating value of coal-tar briquettes is not disputed, and, moreover, I am frank to say that I know of no briquetting plant using coal-tar binder with anthracite fines that has failed, provided the fuel could be burned, as it now is being burned quite satisfactorily on locomotives for instance. My contention, however, lies in the opinion, shared also by certain prominent coal operators and briquette machinery makers, that anthracite briquettes are essentially a domestic, not a power fuel, and that if the present briquetting plants had employed a binder such as will be referred to they would long ago have been enabled to make a smokeless, odorless and waterproof briquette in every way comparable, except in appearance, to fresh-mined chestnut and stove coal. It may also be asserted that by employing such a binder the finished product would have found a ready market at a much higher price than could possibly be expected for a coal-tar briquette—this too at only a slightly increased expense for manufacture.

The basic binder referred to is sulphite pitch—a byproduct of all sulphite paper-pulp mills. The pitch as recovered contains from 25 to 35 per cent. fixed carbon, but this is reduced to 18 to 22 per cent. in the process of briquette manufacture. A certain heat value is thus added to the fuel. This binder does not soften under heat and can be subjected to a high temperature.

To make smokeless briquettes they must be baked to a high temperature. No binder has heretofore been produced that would stand the baking process to as high a temperature as sulphite pitch and gain the desired result within a reasonable cost. Wheat shorts, molasses, starch and other grain and vegetable binders fail to withstand the temperature required to make a uniform and fully smokeless briquette, as beyond a certain temperature, they tend to carbonize like overbaked bread in the oven.

---

*Sales engineer, Cross Engineering Co., Carbondale, Penn.

To further make such a briquette odorless and waterproof three common ingredients are added to the basic binder, completing the formula. For a 2000-lb. ton of briquettes it requires approximately 6 per cent. total binder, or 120 lb., which is reduced in the baking to about 75 lb. The total cost of binder per ton varies from 70c. to 80c. according to the location of the briquetting plant. This cost is low in comparison to the results obtained and the quality of the finished product.

Samples of these briquettes made in an experimental press and subjected to a burning test in a common range, as against fresh-mined chestnut coal, gave the results shown herewith. The briquettes weighed about 1¾ ounces each, a size between chestnut and stove coal, the same weights of fuel being used in each test:

FIRST TRIAL

Drafts On Full

Coal test; ignition period, 12 min.:

Total time until fire died out	3 hr. 50 min
Total unburned coal	2¾ lb.
Total ashes and waste	4½ lb.

Briquette test; ignition period, 14 min.:

Total time until fire burned out	3 hr. 35 min.
Total unburned briquettes	3 lb. (scant)
Total ashes, clear, no clinker	3 lb.

SECOND TRIAL

Drafts On and Off at Regular Intervals

Coal test; 15 lb. used; ignition period, 12 min.:

Coal burned until out	6 hr. 20 min
Unburned coal left	2½ lb.
Ashes and clinker	4½ lb.

Briquette test; 15 lb. used; ignition period, 14 min.:

Briquettes burned until out	7 hr. 10 min.
Unburned briquettes left	2½ lb.
Ashes, clear, no clinker	5½ lb. (scant)

Remarks—The briquettes were entirely smokeless except for a vapor (due to waterproofing ingredient) for about 3 min., noted when fresh fuel was added after perfect ignition had been secured. Briquettes were odorless, no fumes being given off by the stove. Briquettes held their shape in fire until consumed or burned out. The heat developed was, if anything, greater than that from the coal. A test as to the thoroughness of the waterproofing of these briquettes was made by soaking in water for 12 days, the water being then evaporated and the briquettes thrown in the fire, where they burned readily until entirely consumed.

Preparation of Coal for Market

By G. M. Lantz

SYNOPSIS—To secure clean coal for shipment there must be coöperation between the miner at the face and the slate pickers at the tipple. An understanding of the needs of preparation may be fostered by the posting at the mine's entrance of correspondence relative to the condition of coal delivered to the customer.

Coal-preparation might be divided, roughly, under four heads: Extracting, handling, sizing and cleaning.

Most mining men are familiar with the efforts made in mining coal to secure a maximum of marketable product with the equipment on the market for handling the coal to eliminate breakage. They are also familiar with the various sizes produced.

In the Hocking Valley district of Ohio, the mine-run system has served to produce a larger variety of sizes, since most of the smaller companies installed 2-in., 3-in. or 4-in. screens and produce egg, or a grade of large nut. Some of the larger companies had already been loading these grades, under the screened-coal system. In spite of efforts made in some quarters to return to the 1¼-in. lump basis, it is probable that grades of lump from ¾-in. to 6-in. will continue to be produced in Ohio.

A Plan to Secure Better Results

It is not my object to comment on the three first heads under which I have divided coal preparation, but with the last; namely, cleaning coal, or the removal of impurities. This is usually effected, sometimes only partially, by docking and by supervision of loading. I wish to suggest a plan that I believe would be of value as supplementing the two methods in general use. I refer to posting letters from customers at the bank-mouth, for the information of miners.

Obviously it is impossible for the trimmers to remove *all* the impurities from the coal. Part of this work, at least, must be done by the miners. It is also impossible for the mine-foreman to see all the coal loaded. His duties do not permit a thorough supervision of the loading.

Many miners are conscientious and endeavor to load clean coal at all times. Others there are who are inclined to "slip one over" occasionally, in the matter of broken-up bone-coal, fine slate, etc., in the bed of the car, with nice black, shiny lumps for "cribbers." Such a one justifies himself on the ground that the operator would sell the coal if he could, and would be inclined to "slip one over" on the purchaser if it were possible. For there are operators who are conscientious and others who are willing to sell impurities with their coal.

However, the trade demands clean coal, so that the operator, whether he wishes it or not, is compelled to meet the demands of the trade and send clean coal to the market.

Operator's Position Must Be Appreciated by the Miner

In order to produce clean coal, I believe it is necessary for the miner to appreciate the position of the operator—he should realize that production of clean coal is as necessary to him as to his employer. Without orders for coal the miner cannot make wages nor the operator profits.

The following letter, received by an operator from a customer, would be as valuable for the guidance of the miner as the operator:

"We have received several complaints during the last few weeks from our customers on account of excess bone in the coal purchased from you. On investigation, we find the complaints justified. Will you kindly ask your men at the mines who have charge of preparation to be more careful in the removal of bone?"

This letter posted at the bank-mouth, together with a few orders from the customer from whom it was received, would be an impressive object-lesson for the miners. Orders from this customer often run from 10 to 25 cars weekly.

---

*New Straitsville, Ohio.

Or the following letter, posted beside the orders from the sender, would show the miners the necessity for cleaning the coal more effectually than a personal warning from the foreman:

A Warning Letter

"We have noticed in the last few cars of coal shipped from your mine a larger amount of slate than is justified. As you know, we have been featuring your coal, but unless the matter to which we refer is remedied, we shall be compelled in the interest of our customers to buy elsewhere."

And a letter like the following would show the miners the result of thoroughly cleaning the coal:

"Please ship at once, two cars of 4-in. lump coal. The last car was a dandy."

This signifies more than a means of securing clean coal. It means a closer coöperation between the miner at the face and the operator in the particular matter of cleaning coal, and opens the way to a further coöperation in other matters. It is a method of showing that the interests of miner and operator do not conflict. It is a means of taking the miner into the confidence of the operator. Frankness, after all, is a safe policy to follow. It would promote the kind of loyalty Michael Bernard has in mind when he writes:

Although with such importance fraught
And everywhere so widely sought,
It's something that cannot be bought
By gold or hope of gain;
Instead, it wields its power where
Employers' dealings all are square,
Where every rule is just and fair
And every act is plain.

Sizing and Cleaning Anthracite

By F. H. Blatch*

The preparation of coal in the anthracite field increases in difficulty each year. This is due principally to the mining of lower grades, or seams of coal containing bony and slaty material. The big veins of good coal have been the source of output of the mines, and the percentage of these veins grows less each year, while the beds containing more refuse matter are now forming the bulk of the tonnage.

Naturally these conditions have caused great improvements in the preparation of coal. Modern preparation for anthracite coal is based on good sizing and cleaning which can adapt itself readily to the changes and restrictions of market demands. One of the methods of modern anthracite preparation is as follows:

The run-of-mine coal, after it is delivered into the breaker, is divided into three classes of material—large lump coal, bony or intermediate material and mud-screen material. The large coal runs over oscillating bars and on traveling platforms, where bone and rock are removed, while pure lump coal goes through crusher rolls and over separate sizing screens to mix with the mechanically cleaned coal on the way to storage bins.

The large bony material, hand picked from traveling platforms, goes through a separate set of rolls which crush it to commercial sizes, after which it is sized over shaking screens and delivered to spiral separators, which separate the refuse from the coal by the dry method.

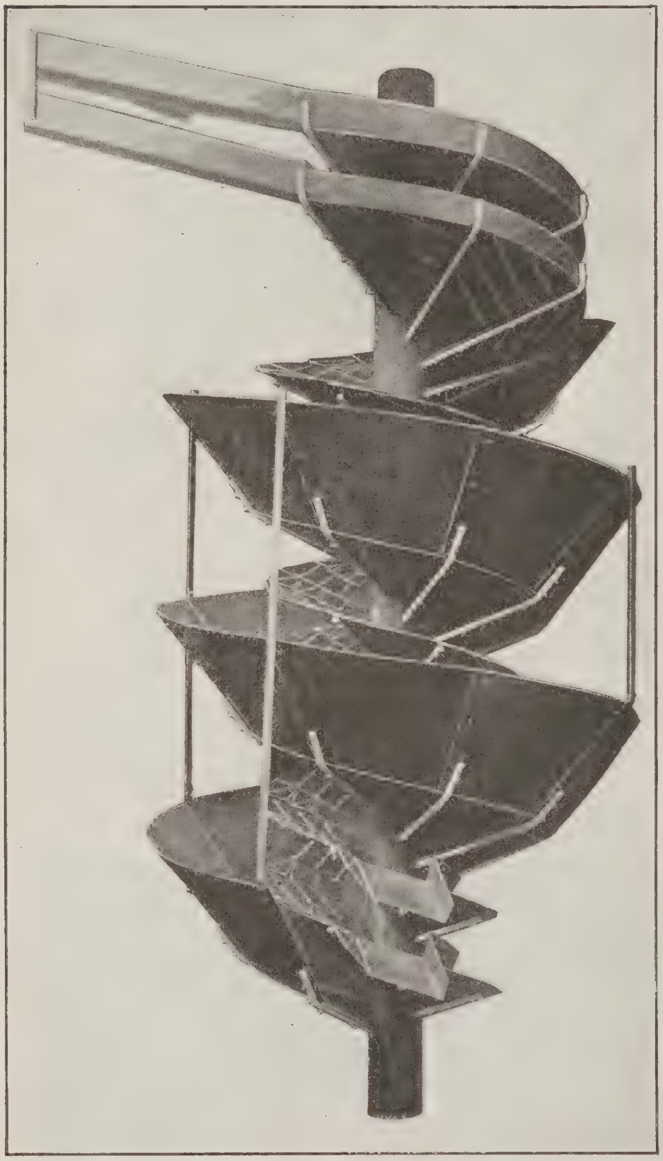
The mud-screen material (from 6 in. down to dirt) goes through the oscillating bars to shaker screens and is thoroughly washed and sized before being prepared over the spiral separators used for wet separation.

Showing Spiral Separators in an Anthracite Breaker

---

*Hazleton, Penn.

These spiral separators are used to give three separations—good coal for the market, cleaner refuse for the rock bank, and a delivery of bony material into a separate course, to be ground to smaller sizes, where it will not affect the prepared coal. With the three-part separation, the appearance of the prepared sizes for the market can be made to satisfy a very exacting inspector without losing the undesirable appearing coal and bony material, which otherwise would be wasted with the refuse if not ground down to steam sizes where the appearance does not affect the burning qualities.



Spiral Separator Used in the Anthracite Field

⁂

Production of Coal Briquettes Increased

A substantial increase in the quantity of coal briquettes manufactured and sold in 1914 is announced by the U. S. Geological Survey. A tendency to operate in large units is illustrated in the statistics of this collateral branch of coal mining, notwithstanding the fact that it may well be considered in the early stages of development, the smaller and experimental plants going out of existence and the new enterprises being of greater capacity.

The production of briquetted fuel in 1914 amounted to 244,635 short tons, valued at $1,123,178, an increase compared with 1913 of 62,776 short tons in quantity and $115,851 in value. This shows the greatest activity in coal briquetting in the history of the industry.

For convenience the Survey has grouped the output by Eastern, Central, and Pacific Coast states. In each of these groups the production in 1914 was greater than in the preceding year. In the Eastern states it increased from 62,244 short tons, valued at $240,643, to 101,782 tons, valued at $273,046; in the Central states from 73,287 tons, valued at $360,408, to 88,325 tons, valued at $424,569, and in the Pacific Coast states from 46,328 short tons, valued at $406,276, to 54,528 tons, valued at $425,563.

Of the 15 plants in operation during 1914, five used anthracite culm as a raw material; two, semi-anthracite; one, bituminous slack; two, a mixture of anthracite culm and bituminous slack; two, petroleum residuum; two, semibituminous slack, and one, a mixture of anthracite culm, bituminous slack, coke, and lignite. Eight plants used coal-tar pitch for a binder, four used secret binders, and one used petrolastic cement. No binder is required in the briquetting of carbon residues from oil-gas works.

⁂

New York School Contracts

By Patrick Jones*

A preliminary analysis of the bids on the coal supply for the New York City Board of Education shows that we will effect a saving of at least $25,000 as compared with the previous contract. We have been the pioneers in the question of economy in the use of fuel, and the following figures will show what has been accomplished in the interests of the taxpayers.

COAL PURCHASES OF NEW YORK CITY SCHOOLS SINCE 1903

Year	Budget	Compared with 1904	
		Decrease	Increase
1904	$584,544.70		
1905	453,387.00	$131,157.70	
1906	451,864.00	132,680.70	
1907	451,094.00	133,450.70	
1908	501,800.53	82,744.17	
1909	501,800.42	82,744.28	
1910	526,880.10	57,664.60	
1911	522,130.95	61,413.75	
1912	561,939.07	22,605.63	
1913	648,687.36		$64,142.66
1914	612,132.74		27,588.04
1915	606,712.15		22,167.45
Total		$704,461.53	$113,898.15

It will be noted that the total reduction in the budgets as compared with 1904 is $704,461.53 and that the total increase in the budgets as compared with 1904 is $113,898.15, making the reduction $590,563.38. The new schools that were not in existence in 1904, but became a liability against the fuel fund subsequently thereto, burned about $1,350,000 worth of coal up to May, 1915. And we met this enormous demand, not with any increase as compared with 1904, but with a total decrease of $590,563.38.

We are still progressing in other directions and hope to effect further economies. One thing is certain—that I will ask for less money for fuel for the schools for 1916 than the amount allowed for 1915; and I am aiming to make my budget for 1916 lower than the budget for 1904.

---

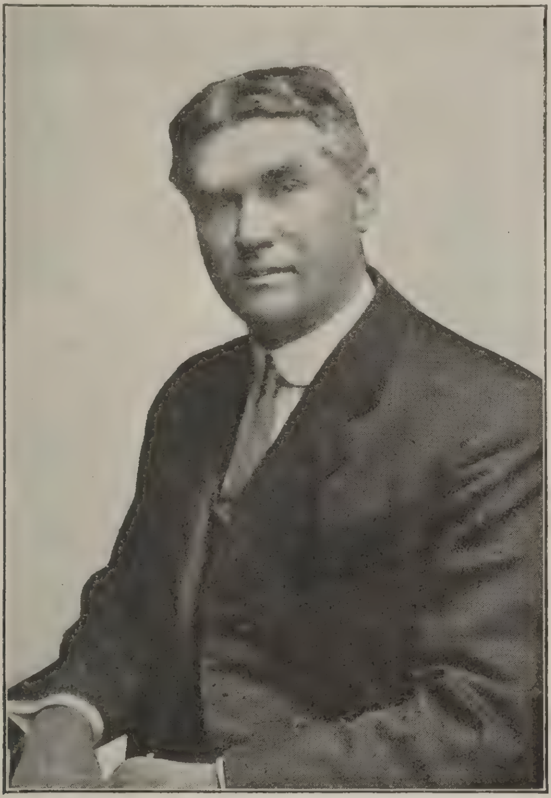
*Superintendent of School Supplies, Park Ave. and 59th St., New York City.

Who's Who in Coal Mining

James Scott Thompson

One of the most successful of the younger men that are now making their mark in the coal-mining business of the Far West is J. S. Thompson, general superintendent of the Utah Fuel Co. Few men are more popular or have a wider acquaintanceship in the coal fields of the Rocky Mountain region than Mr. Thompson.

He was born in Chicago in 1875, but received his early education in the public schools of Denver, Colo, later securing his mining degree in the Colorado School of Mines, where he graduated in 1899. In college Mr. Thompson took a prominent part in athletics, being recognized as one of the greatest foot-ball stars the School of Mines ever turned out. The qualities that made him so popular with his college mates have also served him well in his business associations. His most valuable personal asset is his ability to secure and retain the good-will and confidence of those with whom he deals.



J. S. THOMPSON, OF UTAH FUEL CO.

Soon after leaving college Mr. Thompson entered the employ of the Colorado Fuel & Iron Co. as assistant engineer. In 1901 he was appointed division engineer for the same company and a year later was advanced to the position of superintendent of the Sopris mine. This position he held until 1907, when he left the Colorado Fuel & Iron Co. to become assistant superintendent for the Federal Lead Co., Flat River, Mo.

In 1908 Mr. Thompson accepted the position of general superintendent of the Stone Cañon Consolidated Coal Co., Stone Cañon, Calif. In 1909 he again entered the service of the Colorado Fuel & Iron Co. as division engineer, which position he held until 1910, when he became superintendent of the first division of the company, holding this post until 1913.

After introducing a short course in coal mining at the Colorado School of Mines for candidates to state examinations during April and May, 1914, Mr. Thompson assisted in the mine examinations conducted by the Utah Fuel Co., being appointed general superintendent of the company on Dec. 1, 1914, which position he now holds.

Mr. Thompson is a member of the American Mining Congress, the American Mine Safety Association and the Rocky Mountain Coal Mining Institute.

To Burn Coal Like Oil

Crude oil as a competitor of coal may have a solar plexus blow dealt it soon if the invention contemplated by an official of the Oregon-Washington Railroad & Navigation Co. does what it is expected to do. Many railroads in the country have installed oil burners in their locomotives, but notwithstanding that oil has its virtues, it also has its drawbacks. Railroads that have a supply of coal of their own do not of course relish the idea of buying oil, and as coal is as good for making steam as its competitor is remains to find a cheaper and cleaner means of handling it.

The new scheme is to powder the coal and burn it in locomotives on exactly the same principle as crude oil is burned. Under the prospective process there will be little waste and no smoke, ash or cinders. Should this novel method prove practicable it will mean a great saving in the inland districts, where it is difficult to secure crude oil. It is planned to force the powdered coal into the firebox under steam or air pressure. Thus the fuel will not touch the grates, but will burn precisely the same as gas.

COMING MEETINGS

Rocky Mountain Coal Mining Institute will hold its next meeting in Trinidad, Colo., June 8, 9 and 10. Secretary, F. W. Whiteside, Denver, Colo.

Mine Inspectors' Institute of the U. S. A. will hold its annual meeting June 8, 9, 10 and 11, 1915, at St. Louis, Mo. Secretary, J. W. Paul, Pittsburgh, Penn.

West Virginia Coal Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

Pennsylvania Retail Coal Merchants' Association will hold its 11th annual convention at Wilmington, Del., June 15, 16 and 17, 1915, with headquarters at the Hotel Du Pont.

M. O. I. Coal Association annual meeting will be held June 22-25, 1915, at Cedar Point, Ohio. Secretary, B. F. Nigh, Cleveland, Ohio.

American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

American Mine Safety Association will hold the following meets: July 2-3, Big Stone Gap, Va.; July 23-24, Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

The Order Kokoal will hold its annual pow-wow at Chicago, Ill., July 13 and 14, 1915.

The American Mining Congress will hold its 18th annual session at the Exposition Memorial Auditorium, San Francisco, Calif., Sept. 20-22, 1915. J. F. Callbreath, secretary, Majestic Bldg., Denver, Colo.

Sociological Department

Picker Boys' First-Aid Team Makes Good

When Joe Columbo, an Italian laborer, had his leg squeezed below the knee in the Truesdale breaker of the Delaware, Lackawanna & Western R.R. Co. coal mining department recently, the picker boys' first-aid team was right on the job.

The team has always done well in competitions, but this was a real injury with all its attendant excitement. When Joe Columbo arrived at the Nanticoke State Hospital, Dr. Acyer examined the dressing, and before he knew who made it stated that it was the best first-aid dressing he had ever seen.

Dr. Walter Lathrop, of the Hazleton Hospital, states that since the men have been trained in first aid and learned how to bandage properly and how to use the tourniquet, almost 90 per cent. of the amputations formerly necessary have been eliminated, except where the muscles are torn and the artery crushed or severed. The destruction of the softer fleshy parts of a limb is now a more serious matter than the fracture of a bone, as the Hazleton Hospital is now doing some marvelous bone grafting.

The value of the first-aid work in preserving limbs lies in the fact that the patients no longer arrive at the hospital exhausted from the loss of blood. Dr. Lathrop, however, adds a word of caution advising the loosening of the tourniquet once in awhile so as to partially restore the circulation of the blood if much time is necessary to get the patient to the hospital. Dr. Lathrop was the pioneer of first-aid training for the Lehigh Valley Coal Co. and still acts as a judge at their annual first-aid meets, so that he is familiar with both its theory and practice.

A Plea for the Miner's Wife

By Mrs. Edmund Ewing*

There is something of the aesthetic in every human being, no matter what his occupation or profession. A wee baby is attracted by bright colors; the attraction grows as the child develops, until all nature, clothed in various garbs, becomes a part of his personality and is always an inspiration to him. Have you never thought that the miner, living so much in the dark, must unconsciously miss the glories of the day, and have you never felt that his home, above all others, should be attractive?

When I knew my home was to be in a mining camp, I was elated; for there, one being relieved of obligations, social and otherwise, the "home beautiful" and hence the "camp beautiful" is the chief concern; in other words, one can make one's own environments. Much to my disappointment, I found that in this particular camp there were few homes that had even a vine on the porch. Naturally, the first impulse was to censure severely the wife who had not the pride and energy to try to make a home for her husband. Several inquiries were made as to the cause of the seeming negligence, with always the one answer, "Try and you'll find out."

This is what was found out by one person who tried. Fertilizer was to be had for the asking; so a goodly amount was distributed on both yard and garden, the yard was sodded, seeds were planted in both front and rear, and chickens were bought and comfortably housed. All this required work; for not only did we have a virgin soil to deal with, but the lot was on a hillside and the ground was hard, yielding only reluctantly to pick and spade.

All went well until the hot summer days ended all our prospects. Hose was purchased, but there was no water in the pipes. The ground had been mined underneath.

In the meantime, we had been making notes about those wives we had censured, and because of the observations we made I am making this plea for the betterment of their conditions. Besides the regular cooking, housecleaning, mending, sewing, caring for the children, there was the laundering, especially heavy in a miner's family, and the supplying of water for the men's baths for the housewife to take care of. In many cases this water had to be carried some distance. I remember that in one house there were nine men; one young girl and the other help about that house actually carried water a length of about two city blocks. It is needless to say that the bloom early fades and the wrinkles appear in such instances.

Welfare of the Miner's Wife Is Entitled to Consideration

I have often thought that it was just as necessary to protect the lives of the wives outside the mines as those of the men who have to work inside them, for the women are being killed surely though slowly.

It does seem that with just a few modern conveniences their work might have been lightened one-half, and they could have expended that extra energy, not only in making their surroundings more attractive, but in planting their own vegetable gardens with a small amount of help from the husband, thereby supplying their tables with fresh, nutritious vegetables at little cost. The chickens, too, could have supplied a goodly portion of the food with an even less expenditure.

With other conveniences the husband could have stayed in the house at night and read his evening paper comfortably, instead of sitting on the porch trying to read by a smoking lamp, as they have often been seen to do.

It does seem that the well-kept home, the fresh food, the lowered cost of living would have proved an incentive and the men would have given the company better service, and what a source of pleasure it would have been to the wife, who was naturally blamed because it took one hard day's earnings to furnish food for the next.

It was my good fortune to visit several times a nearby camp that not only had these modern conveniences, but one where gardening was encouraged, prizes were offered for the prettiest yards, clean-up days were observed, splendid teachers were employed in a beautiful, modernly equipped school, and there was a decided difference in conditions.

---

*Wylam, Ala.

Some have said that this was due to the fact that the financial heads are located in this camp. Well suppose we take a look at some of the Tennessee Coal, Iron & R.R. Co.'s camps, the most beautiful in the South. Yet most of the financial heads of that corporation really knew very little about them. Don't you suppose that the men in charge realize that the best dividend-paying company is the one that gets the most efficient work, and this kind of labor is to be obtained only when attractions are such that they not only draw the best class of miners, but get the greatest amount of work from the least suitable men?

Have you ever thought that it is the wife who profits most by the conveniences furnished and she is the greatest incentive to the man's work? My great desire is that all companies will realize the necessity of taking care of the miner's wife, and in turn the business of the corporation will be taken care of. The plan has been tried and has never failed.

THE LABOR SITUATION

SYNOPSIS—Even the Federal Industrial Relations Commission has ceased to trouble the waters. There remains nothing but the apprehension of what will happen in 1916. The union hoped to make the greatest struggle on record at that time, but for it the miners have only the leanest of purses.

The Federal Industrial Relations Commission has ended its sessions. Francis Patrick Walsh, much to his regret, is no longer a headliner in the news. Appointed by the President on June 26, 1913, he has been virtually repudiated by him, for when Walsh sought to obtain a letter written by Governor Ammons to the President, the secretary to the President refused to comply with his request.

His colleagues became more and more restive under his leadership as the weeks wore on; notably Harris Weinstock and Mrs. J. Borden Harriman. The first objected to his asking questions of John D. Rockefeller, Jr., which had not previously been submitted to that witness, others under examination having been informed as to the questions to be asked. All the members objected apparently to his rudeness in examination and signed, it is said, a "round robin" of protest. Whether such a paper was prepared is open to question as the public was not permitted to see it.

But we should not be too severe on Mr. Walsh as his wildness has undone him and helped the cause of those he would injure. On May 31 he made a statement summarizing what he pretended to believe he had proved against the John D. Rockefellers, father and son. One paper felicitously termed the notice, "Walsh Again in Eruption." It would not serve any useful purpose to publish his baseless diatribes.

W. L. Mackenzie King when being examined found much fault with F. P. Walsh's manner of questioning, declaring it injudicial. Harris Weinstock, Walsh's colleague in the commission, then tried to find what was the object in his line of questioning, and Walsh curtly replied that he, Walsh, was not on the stand and would not consent to be questioned.

Gallagher Amendment Is Signed

On May 27, Governor Willis signed the Gallagher amendment to the Green antiscreen bill, that being the last day on which action could be taken. The labor leaders brought much pressure to bear on the Governor, hoping that he would veto the bill, but he took the position that everyone should be permitted freedom of contract. It is said that at an earlier stage he was urgent in advocating the passage of the amendment. In his message he declares that he might have let the instrument pass by default, but he was opposed to evading his responsibilities. He ascribed much of the idleness in Ohio coal mines to the unfortunate Green antiscreen law.

The miners talk of endeavoring to have the bill recalled, and it must lay over for 90 days to give time for such action. A meeting of the executive committee has been called to discuss this referendum petition, but there seems no marked desire for it as practically all the mines are on a run-of-mine basis and will be till Mar. 31 of next year.

Despite the Long Contract and Wearisome Experience Strikes Continue

About 200 miners employed at the Majestic mine of the A. G. Blair Coal Co., at Blairmont, in Jefferson County, struck last week because it was claimed that all their wages were withheld to pay the deferred rent on houses occupied by them. The men say that during the conference over the wage scale at Cleveland the operators promised they would be lenient in the collection of such debits.

Another cause of dispute at Blairmont arose out of the ad interim arrangement which is to continue in force till equipment for weighing run-of-mine coal can be installed. The company declares that the miners were promised 24 per cent. additional pay for the unweighed slack. C. J. Albasin says that 32 per cent. was promised. As the agreement was verbal the correct figure will be hard to determine. The operators are given 60 days to remodel their tipples so that they can weigh the coal as it comes out of the mine.

The miners' organization is still demanding that the miner stockholders of the small West Wheeling mine, near Bellaire, join the union. The mining company is a sort of coöperative concern, and when the stockholders appeared to work in the mine about 17 union workers laid down their tools. It is claimed by the stockholders that they cannot join the union because they are members of the Pittsburgh Vein Operators Association and cannot be members of contending organizations.

At one time the stockholders were all members of the union, but left to avoid voting against their own interest. The labor leaders tried to force them into the union, but after paying their money the stockholders of the company found they would not be allowed to vote in the labor organization, and after making a protest the union returned their checks.

In 1906 after a general strike the company was not allowed to resume work, and for the first time employed nonunion men, continuing this practice for about 16 months. Before and since that time they have never employed nonunion men according to T. H. Johnson, the treasurer of the company.

Anthracite Labor Problems

The employees of the Henry shaft of the Lehigh Valley Coal Co., at Plains, presented their grievance before Judge Gray, the umpire for the Anthracite Conciliation Board, on Nov. 28. The men claimed that at one time they were paid 55c. per lineal foot for rock removed from the roof. Some time ago the company decided that the cars should be more heavily "topped," and consequently it was necessary to take down more roof in the "five-foot vein" so as to permit of the change. The yardage rate was then increased to $1.10 per lineal foot.

Later on the company opened another section of the same vein, and the men were paid the first or lower rate. It was shown that there was little or no difference in the earnings of the men in the two sections of the mine, and consequently the arbitrator was satisfied that the old rate was reasonable for the work to be done and gave his judgment accordingly.

The coming "spring drive" of the union on the operators in 1916 is naturally a matter of much speculation. It is to be hoped that the large program demanded will be considerably modified. The 8-hr. day for day hands will probably be a leading item, and it should be conceded. It has often been found that mining regions persisting in long working days manage to put out less coal than those which work a shorter time.: Illinois is an example of what can be done in a short working day.

An anthracite strike is almost sure to fail because of the lack of funds. Nothing can make it win except unreasonableness on the part of the operators. Seeing that the present heads of the companies are advocates of everything that is fair to their workingmen, they can rightly anticipate speedy success in arriving at a satisfactory settlement.

*

Injury to Miner Through Fall of Slate—A coal operator who directs a youthful and inexperienced miner to work under slate which is apt to fall is liable for consequent injury to the employee, who is entitled to assume that he will not be directed to work in an unsafe place. (Kentucky Court of Appeals, Garrard vs. Interstate Coal Co., 173 Southwestern Reporter 767.)

Editorials

The Mining Institute and Statecraft

The New York section of the American Institute of Mining Engineers approved the action of the three representatives appointed by the parent body in signing recommendations for amendments to the state constitution. It further authorized these three committeemen to coöperate with various other bodies of engineers and to act in the name of the New York section. It is a somewhat peculiar condition which is responsible for this action.

The members of the New York section of the Institute are little interested as engineers in the constitution of the state, and while more competent than the average man to decide on the necessities of statecraft, they have little vital interest in the problems of the state in which they live. In fact they would not have considered them seriously as a body, or perhaps as citizens, had they not been urged to take that interest by engineers of other types, such as members of the American Society of Civil Engineers, whose knowledge of the necessities of good government from an engineering point of view has been quickened by almost daily contact with the problems involved.

Despite the sterling character and qualifications of the men who will act on behalf of the section—W. L. Saunders, Benjamin B. Lawrence and J. Parke Channing—it is to be expected that the leaders in the deliberations will be men in societies having to do with civil engineering in its various branches. The coöperation, however, is suggestive of what the other sections of the institute may do where their vital interests are involved. It may well be that the American Institute of Mining Engineers as a body will take action of a statesmanlike character which will clarify the public mind on questions of national polity.

The Institute as a whole may well hesitate to discuss plans to regulate or dispossess the State Engineer and Surveyor, or to provide for the creation of a Department of Engineering and Public Works or of Public Utilities or of a Court of Public Claims, for these are matters of which it does not have the intimate knowledge and personal touch needed for decision.

But the Institute does have the information necessary to aid in preparing codes, constitutional and legislative, on matters such as the staking of claims, the setting of land values, the compensation of workingmen, the preservation of the lives, health and safety of miners, the regulation of competition, the assessment for taxes and the advancement of conservation.

And it is interesting to note that there is a disposition to treat these matters on the broadest basis, the members regarding themselves as citizens, not defending their personal interests, but those of the public. They act as engineers solely where their engineering knowledge gives them a peculiar ability to discuss certain problems.

It is to be hoped that this attitude will continue and the aim be, whole and entire, the interest of the republic and not an undignified desire to advance the interest of the engineering profession and the business concerns with which it is related as against that of any other body of citizens.

It is well known that there is a body—the American Mining Congress—the aim of which is solely to correct abuses of the police power as exercised over the mining business, and it is therefore argued that other societies should be solely technical and avoid discussions of "politics." But the purposes of the Congress are so clearly to advance propaganda of this sort that it cannot work so effectively on the public mind as an organization the purpose of which has primarily no relation with the issues involved, the members of which moreover are not likely to be directly enriched or impoverished by any political action however drastic.

There are instances where the engineers are pecuniarily interested in legislation. But in those particular cases the Mining Congress is not likely to help them. The engineers believe that engineers should be in charge of engineering work or at least adequately represented. We do not know of any body of business-men or lawyers who are agitating this principle for which the engineers are contending. Every indication is that they desire to occupy these positions of trust themselves and would relegate the engineers to the place of "hewers of wood and drawers of water."

In fact it has been increasingly evident that any man who desires to qualify to be placed in charge of works of national and state importance should study Blackstone rather than graphic statics and hydraulics. Though mining engineers have been sufferers—in the appointment of receivers, for instance—they have not been the leading victims of this unfair preference for lawyers. They do well, however, to add their protest to that of their professional brethren.

Too Many Societies

We all hear a great deal about there being too many institutes, and doubtless there are too many uncoördinated overlapping institutions. But most of the objection is really to societies generally, and the remark is as reasonable as one which we used to hear—"too much education."

We cannot have too much collaboration in human effort. We cannot have too much research. Too much publicity is difficult to conceive. The world will never go ahead unless we make the knowledge of one the property of all. "Too much endeavor," "too much fraternalism," "too much coöperation"—such statements are absurd on their face; and those who condemn societies perpetrate this folly, though possibly they do not know it.

The societies need vitalizing, it is true. Some of the papers presented at their sessions are clearly written to order, like those essays we wrote in earlier days with sundry bitings of the heads of our pencils. Too many are accepted because they are contributed by men with a good position rather than an active brain or a telling message. Big men with nothing to say should give place to little men who have a compelling thought and time to formulate it for the benefit of the public.

Our societies are feeble because we do not take them seriously. It should be a recognized offense, and one not to be condoned by platitudinous compliments, to deliver an address and say nothing. Have not a hundred or so members who have traveled as many miles a right to reproach bitterly a speaker who wastes their time by saying nothing or insults their intelligence with an address that he has been too lazy to prepare with care? He should be compelled to make the hundred 100-mile trips himself as a penace for his effrontery and folly.

But these are days when we regard criminality with leniency, as a weakness, symptomatic of a disease, and not as an offense. So we must bridle our resentment and admit that it is impossible to visit on the offender all the burden of his grevious offending. We must be content to let him continue to owe a debt to his more conscientious fellow-citizens. Perhaps the author of a poor article believes he is doing the public a service, for what is a light to a bat is darkness to a man.

If our societies were all they should be, why should we begrudge them our money, for indeed it is only a few dollars we are asked to give to progress and to inspiration? For what else do we live except to move forward and to dream? Surely it is not a vegetating life without hope or progress that we seek.

※

Middle Western Crops and the Coal Markets

The outlook for wheat in Indiana and Illinois is encouraging, and the farmers are getting a good start with corn. The smaller crops are also looking better than usual, so that unless conditions later are adverse there should be an abundance of money in the Middle West this fall. This will undoubtedly have a tendency to stimulate industrial and business conditions generally and be of material assistance to the coal operators

A promising sign is further noticed in the tendency of shippers to withhold free coal from the Western markets; most operators have gaged their output exactly to meet the current demand, and this has been one of the main factors in causing high prices for screenings.

※

Pennsylvania's Anthracite Tax

The Pennsylvania Legislature has just concluded its sessions, and the coal companies as usual have watched its deliberations with much interest. Probably the most important piece of legislation enacted was a new anthracite tax law, which retains the old figure of 2½ per cent. on the market value at the mines, but is essentially different from the original act in that it makes a new division of the proceeds from the tax levy. Under the new law 50 per cent. will revert directly to the state for road development throughout the commonwealth and the remainder will go to the county which produced the coal. A bill was introduced to repeal the old act, but it was not heard from.

The passing of this new act shows that the legislators must feel secure as to the constitutionality of the new law. As will be recalled, the validity of the old act is now being contested, and it was expected that the Supreme Court would fix a time during the past week for hearing an appeal from the decision of the Dauphin County court, which sustained it. But the Supreme Court adjourned without fixing a date, and it now seems that a decision is far in the future.

※

Nullification

A sister state, Pennsylvania, scorning all the sentiment of the times for a just distribution of the burdens of government, has put a tax on anthracite with the express purpose of making New York State pay the major part of it. It is not laid for the benefit of those subject to the peculiar drawbacks and dangers of the industry, or why should the whole state receive a part of it?

It is purely a steal, and the offense is not mitigated by any desire of self-protection, which is the alleged cause of most tariff. It is for revenue only, the purpose being to make the people of New York State, rich and poor, pay tax in the State of Pennsylvania.

As an attempt to enable one state to pay its bills by taxing the consumption in another state, it is practically nullification. The courts may not so rule, and from a legal point of view they may be right. But there is a larger sense in which the anthracite tax is an offense against the Union.

※

Anthracite Production Slow

The production of anthracite in May reflected the industrial depression in many lines of business and was not equal to that of May a year ago. Shipments of anthracite in May, 1914, amounted to 6,281,553 tons, but it is probable that they fell below 6,000,000 tons last month.

According to the record of the Bureau of Anthracite Statistics shipments for the first four months of 1915 were 52,809 tons less than shipments for the first four months of 1914. When May is included the shipments for the five months of 1915 will probably be from 350,000 to 400,000 tons less than for the corresponding period in 1914.

※

Fishponds and Temperance

The Donohoe Coke Co. has a large reservoir, which it stocked with fish three years ago. The fishing rights in this pond were recently sold to the Greenwald Temperance Society for the exclusive use of members. No one can join the society without signing the pledge. But those who won't sign it say, What is fishing without a bottle?

※

Bathhouses in Kansas

The legislature in Kansas has passed House Bill 1033, providing that all mines must be equipped with bathhouses, which must contain several shower baths, also a locker for each miner. Kansas is progressive as usual.

※

The July 3 issue of Coal Age will be devoted entirely to coke and its byproducts. All of our readers are invited to contribute articles dealing with some phase of coke manufacture. Manuscripts should be in our hands by June 24, or sooner.

Discussion By Readers

Mining Laws and Legislation

Letter No. 4—I was much interested and somewhat amused at the letter of I. C. Parfitt, COAL AGE, Apr. 10, p. 651, in which he seems to have had some difficulty in interpreting the meaning of that section of the bituminous law of Pennsylvania relating to the legal responsibility of the assistant mine foreman.

Apparently Mr. Parfitt thinks that because the assistant foreman works under the instructions of the mine foreman he is not personally responsible for the results of his action. When the present bituminous mine law was framed it was well known that the majority of the mines were so extensive that it was impossible for the mine foreman to visit all the men in their working-places every day. For this reason the clause was inserted in the law giving the foreman "the right to employ a sufficient number of competent persons to act as his assistants," stating further that they "shall act under his instructions in carrying out the provisions of this act."

It will be readily agreed that an assistant must always work under the instructions of his superior in office. In my opinion, however, this does not relieve the assistant of his personal responsibility in carrying out his orders. As I understand the law, both the mine foreman and his assistants are personally responsible—the mine foreman for the orders given to his assistants, and the assistants for the faithful performance of the same. Certainly the mine foreman cannot be held responsible for any carelessness or personal neglect on the part of one of his assistants, He can be held responsible only for the orders he issues and for the employment of those he believes to be competent men to act as his assistants.

I do not think for a moment that any mine foreman would attempt to hide behind his assistants or throw a responsibility that was his own on the other man's shoulders. When a mine foreman employs an assistant, he does so believing that he is capable of assuming the responsibility for the district placed in his charge. One might gather from Mr. Parfitt's remarks that he regarded the mine foreman as a mere figurehead who is authorized by law to employ a sufficient number of assistants to perform the work that was properly his own. Anyone familiar with the situation, however, knows that the mine foreman of a large mine has a hundred and one things to look after besides personally visiting the men in their working-places.

I believe the mine foreman should visit and carefully inspect certain portions of the mine every day himself, but his attention should be given mostly to those portions of the mine and to those matters requiring his personal oversight. There are no "figureheads" under ground and no place for them. The company pays the mine foreman a good price for knowing what has to be done and what men are best adapted to perform different classes of work. Each assistant and each workman employed in the mine is paid in proportion to his responsibility and the class of work he performs.

I might sum up by saying that in my opinion an assistant foreman is held legally responsible for anything that goes wrong in his district owing to his own neglect or carelessness in the performance of his duties of inspection. No judge or jury would convict a mine foreman for an accident arising from the carelessness or neglect of an assistant foreman, who must be responsible, as I said before, for the faithful performance of the duties laid upon him.

THOMAS HOGARTH.

Burgettstown, Penn.

⁂

Longwall in Pittsburgh Seam

Letter No. 9—I have followed with a great deal of interest the discussion of the question of whether the No. 8 or Pittsburgh seam can be worked successfully by the longwall method of mining. Inasmuch as I have had experience in working this seam and have studied its character and that of the overlying strata, I want to say that my conclusion is that the No. 8 seam cannot be worked profitably on the longwall advancing system.

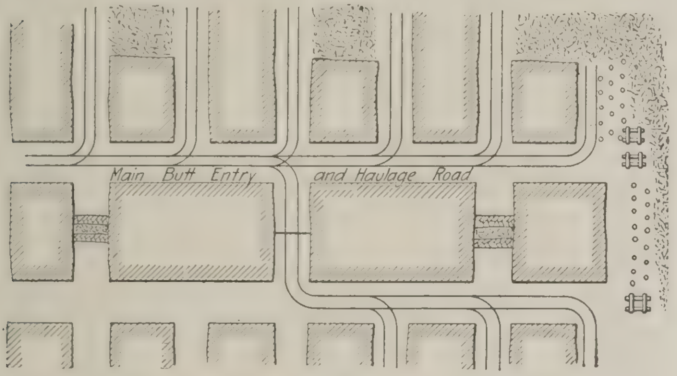
For many years I was in charge of longwall work in our mines and visited a number of other mines that were being worked on the same plan. Some of the mines visited had a very tender roof, but were worked with profit to the operator. Where the roof was tender, the longwall face was always carried forward in steps (see Fig. 3, Letter No. 8, May 29, p. 940), so as to prevent the formation of a continuous break that would destroy the action of the roof, which is so necessary in the longwall system. In our mines each working place was kept 15 ft. in advance of that next following. The roof being tender, a break only extends as far as the steps, which arrest its progress. By this means, a general subsidence of the roof along the entire longwall face is prevented. In these mines the tender roof extended a good many yards above the seam itself, which is not the case in the No. 8 seam, where the tender roof extends only to the limestone—a distance that varies in different parts of the Ohio field, not exceeding 5 ft. in some places.

In considering the question of longwall, it is important to remember that the strata overlying the No. 8 seam is not at all suitable for packing material, because it crumbles quickly, especially if it is damp, which is the usual condition. For this reason the packwalls would not stand the pressure necessary to break the limestone, and as a result the roads leading to the face would be entirely lost and the working places would soon cave, when it would be found practically impossible to keep the work open.

Referring to the longwall retreating method proposed by John Oldroyd in Letter No. 7, May 15, p. 859, for working this seam, I would say that practically all the coal could be extracted by this system, but few operators would care to adopt the retreating method owing to the length of time required to extend the entries to the property line. The retreating method of longwall not only possesses the disadvantage of late returns on the investment, but the operator in most cases is not in a position to buy all the coal he desires at the commencement of operations and must wait until his returns enable him to make a further investment, which is not possible in the longwall-retreating system. The working of future acquisitions would require the sinking of new shafts and the providing of another surface plant and equipment.

At the present time there is not more than 60 per cent. of the coal extracted in a majority of the mines working the No. 8 seam in the Ohio field. No one will deny that it is shameful to admit that more than one-third of the coal must be left in the mine in working this seam, and it goes without saying that some other method than that in present use must be adopted whereby more coal can be recovered.

I would suggest, briefly, that the plan might be tried of driving double rooms, say 32 ft. wide, as shown in the accompanying figure, the room necks being driven 8 ft. wide, a distance of 7 yd., leaving a 16-ft. entry stump between the openings. A track is laid along the straight rib on each side of the room, and a 32-ft. breast is driven up a distance depending on the conditions in any case. When the room has reached its limit, the 16-ft. pillar between the room and the one next adjoining is cut across at the face and the room pillar drawn back by taking a 5-ft. skip along the rib, using for this purpose a shortwall machine. When driving up the rooms all the waste is thrown into the center between the two tracks, which leaves the ribs clear and enables them to be drawn back readily.



Proposed Plan of Working No. 8 Seam

I have outlined in the figure the general plan of this work. The butt-entries are driven 10 ft. wide with a pillar 8 yd. wide between them. When all the rooms of a pair of butt-entries are driven up, and the room pillars drawn back as far as the entry stumps, the work of drawing back the entry pillars and entry stumps is commenced. As shown in the figure, this work of drawing the entry pillars is started from the inby end or head of the entry on the retreating plan.

I believe that this method or a similar one will enable 95 per cent. of the coal to be extracted. The driving of wide rooms will produce a much larger percentage of lump coal. It will generally be found that two shots will be all that is required to break down the coal in a 32-ft. breast.

In drawing back the entry pillars and stumps, cribs should be used and switches laid at the face, as shown in the sketch. The cribs can be removed and used again repeatedly as the work progresses; likewise also the posts, which are set in two or three rows along the face of the pillars. It is important that these cribs and posts should not be drawn too rapidly, in order to prevent the roof from breaking over the pillars. A Sylat post puller should be used for drawing the timber. This machine allows the man to stand in a safe place a number of feet away from the post he is drawing. The cribs should be made of hardwood, each stick measuring 2 ft. in length and 8x8 in. in section. When building a crib, the first stick must be laid on a few shovelfuls of fine dirt, so as to provide for its ready removal when desired.

Harry Marson.

Wolf Run, Ohio.

The Mine Car Question

Letter No. 2—Manufacturers and mining men generally have doubtless read with interest the article by R. Z. Virgin, Coal Age, May 1, p. 752, relating to mine cars and the changes that have taken place in their construction during the past few years. I notice that Samuel Dean has drawn attention to the same subject and has suggested a discussion of the question to bring out more clearly the conditions that must be met and the requirements of mine cars for good service. This inquiry of Samuel Dean appeared in Coal Age, May 22, p. 904, and in the same issue, p. 900, was an interesting letter by P. F. Lynch, superintendent of Cross Mountain Coal Co., Briceville, Tenn. Discussions of this sort should prove very profitable both to the makers of mining equipment and to coal operators and mine superintendents.

Mr. Virgin's remarks are undoubtedly, for the most part, well founded. In the past few years there has been a tendency toward an extreme "battleship" type of mine-car construction at a great many mines. There has naturally followed a train of evils such as mentioned by Mr. Virgin; namely, the increased difficulty of handling the cars in the mine at the working face, the necessity for heavier locomotives to haul the cars and the requirements for heavier rails, and finally an increased cost of maintaining the roads in good condition. We have recently noticed, however, a tendency on the part of the more progressive mining men to get back to a lighter form of car for mine use—one that is especially adapted to the most economical handling of the coal under the particular conditions existing in their mines. As a consequence, the capacity of the cars, their length, width and height, size of wheels and track-gage are specified to conform to the conditions existing in the seam from which the coal is mined.

In considering this question, it is important not to overlook the changes in conditions with respect to underground haulage that have taken place during the past few years. In most mines mule haulage has been supplanted by some form of rope or locomotive haulage, electric or compressed-air locomotives being largely used on main-haulage roads. These changes demand a corresponding change in the character of the mine car and its equipment in order to obtain the greatest benefit and operate the system with the most economy.

While a mule can haul a certain tonnage per hour under given mining conditions and a light mine car built with a simple truck will stand up under the strain imposed by such a method of transportation, it must be remembered that under the increased tonnage hauled per hour where mechanical haulage is employed the same car will not prove adequate, and as a consequence the cost of maintenance is greatly increased, repairs being more frequent and the life of the car being greatly diminished.

Practical mining men know that when a powerful locomotive is employed larger trips are hauled, and the consequent strain and jerks to which the cars are subjected soon send them to the repair shops and it is not long before they are relegated to the scrap heap. Again, the increased speed of hauling the cars is wasteful of the oil, which is thrown from the journals unless an improved form of car-wheel is adopted. The old-fashioned wheels are cut out, as a rule, in a few trips and become unserviceable.

To meet these arduous conditions requires an increased size and strength of the drawbars and other irons with which the car is equipped, and in many cases channel bars must be employed to give greater strength and rigidity to the cars. The manufacturers of car-wheels have sought to develop a type of wheel that will stand the increased severity of the service and carry the heavier loads at the greater speed without cutting out the wheels and with the greatest possible saving of power.

The roller-bearing wheel, in its present state of development, is the result of these efforts of car-wheel manufacturers. It is true that a set of four wheels of this type, for a 42-in. track-gage, the wheels being 16 in. in diameter and set on 2-in. axles, will weigh with boxes and bearings complete 125 lb. more per set than the simple type of truck formerly used, which is approximately an increase of 25 per cent. in the weight of the truck. But for this increased weight in the truck there is gained the decided advantage that the drawbar pull is reduced from 30 or 40 lb. per ton to as low as 11 lb. per ton of load hauled. This alone shows a total saving in power of from 60 to 70 per cent. The wheels will also run from 6 to 18 months without regreasing and will not cut out in the hub at any speed or length of haul.

The improved equipment of roller-bearing wheels, permitting the easy starting of the car, makes the proposition of handling the cars by hand in the rooms and working places a very simple one and is an important factor in increasing the daily output from each working place. It may be stated with certainty that the results obtained by the adoption of this improved equipment in mine cars fully justify the additional weight of the trucks and the increase in first cost of the equipment.

⁂

Stopping Payroll Leaks

Letter No. 4—It is commonly recognized in all mining communities today that producers of coal must look carefully to the cost of operating their mines. It is well known that the daily tonnage of a mine has a direct and powerful influence on the cost-sheet. Keen competition, however, has developed the fact that tonnage is not the only factor to be considered in relation to the cost of coal production.

Competition in the coal industry has necessitated a most careful preparation of the coal shipped to market. This is especially true in respect to the larger sizes of coal shipments. Again, the quality of the coal or its *heat value* is another determining factor in its selling price. Coal is now largely purchased by contract based on the heat units of the coal per ton as determined by analysis.

These conditions affect the coal miner and laborer equally with the operator. It is therefore a matter of great importance to all concerned to consider carefully what can be done to reduce the cost of operation and increase the value of the product. In this connection, I was glad to see the reference made by F. M., in Letter No. 3, Coal Age, May 22, p. 901, where he draws attention to a few of the "small items" that are so generally lost sight of in the operation of a mine.

I desire to refer briefly to one or two points of mismanagement that are of frequent occurrence in the mining of coal. I want to say first of all that the selling price of coal on the market does not dominate the conditions in a mine as much as the system of mining employed in the extraction of the coal. It is well known that market conditions vary. At times the demand for coal so far exceeds the supply that all mines are operated at their full capacity and every effort is made to produce a large output. At such times the demand for coal almost completely absorbs every other interest and things that should receive attention underground are neglected.

A little sober reflection will convince any practical mining man that this condition is wrong, as far as the cost-sheet is concerned. It is when the times are good that provision should be made for the carrying out of plans that will insure a more regular output in the future working of the mine. The necessary work of prospecting should then be performed and the required amount of narrow work pushed forward with great energy.

As a rule when the times are good and the demand for coal is urgent work is abandoned on the low coal and frequently pillar work is neglected, while the most attention is given to the thick coal. Would it not be better to give the same attention, as far as practicable, to all sections of the mine, with a view to its future development and keeping the workings generally well cleaned up? The extra expense attending many of these operations can be better borne when times are good than when the demand for coal is slack.

It seems only natural to consider that when times are poor the cost-sheet could be much reduced by giving more attention to the working of wide rooms and thicker coal where the best quality of lump coal can be produced at a small expense of labor. If necessary, at such times, stop all narrow work and all unnecessary day work. Due consideration should be given to the fact that when times are poor it is often possible to secure both labor and material at a reduced cost, and for this reason necessary development work can often be projected to advantage. I have often observed that the general tendency of operators in a dull season is to retrench and refuse to do such work until the approach of better times, when it is frequently difficult to secure the needed labor and material promptly as required.

I recall one instance when the mine where I was working only ran about eight or ten days in the month throughout the winter. Prospects improved on the approach of spring, and with a new contract in sight word was sent into the mine requiring a certain number of cars of screen coal. This was wanted at once for sample coal. It was found, however, that it was impossible to supply more than half of the number of cars required of this kind of coal. An investigation was started to ascertain the reason for this and developed the fact shortly that the fault lay in the underground planning and development.

At first miners were blamed for not drilling the holes in the proper location for blasting, using too much powder, not undercutting or shearing their coal so as to give a shot the opportunity to perform its work and finally for the practice of shooting coal from the face before cleaning up the coal of a previous shot. All of these causes, it is clear, help to produce much fine coal and slack.

I believe, however, that the mine officials were more to blame for the overproduction of slack and fine coal than the miners themselves. Investigation showed that, in one fireboss section, out of 43 working places there were 25 employed on narrow work or entry driving, while five of the *rooms* also had to be driven narrow owing to bad roof and could not be cut with the machines, but must be worked by pick miners. This left only 13 wide rooms in this section containing 43 working places. Beside all this there were, in the same section, 18 cut-throughs being driven, which greatly increased the amount of fine coal and slack. No argument is required to show that this was a case of mismanagement and little foresight in planning and carrying on the work underground. It was found that at least 50 wide rooms could have been turned and put in condition for a good output of coal when needed.

Frequently the mistake is made of abandoning certain sections of a mine for work in other sections because of certain market requirements. In some instances rails, ties, posts, wire, pipe lines and other equipment are withdrawn for use in another section of the mine, only to be replaced later when work is resumed in the section from which they were taken.

While it is readily agreed that such a proceeding may be necessary to some extent under certain conditions, it is clear to all that every effort should be made to avoid such an exigency. The abandonment of a section of the mine before it is completely finished most always means an increased expense to clean up the rooms and roadways and equip the section again for work. Experience teaches that coal can always be mined more easily, and with less expense and greater safety, when the work is continued until the extraction is complete. I have worked at mines where certain sections have been abandoned once or twice before the pillars were finally drawn. In my opinion such practice is careless, expensive and dangerous in coal mining.

Study Course in Coal Mining

By J. T. Beard

The Coal Age Pocket Book

Molecular Theory of Matter—Chemical investigations have led to the accepted conclusion that all matter is composed of minute particles called **molecules**, the molecule being considered the smallest division of which the matter is capable without destroying its identity.

Theory further assumes that the molecule is composed of two or more **atoms**, like or unlike, but bound together by a force of attraction for each other known as **affinity.** Each of these combined atoms represents an **element** or a particular kind of matter and their combination as molecules diversifies matter and creates substances of various nature and kind.

Atomic Weight—Atomic weight is simply relative. The atom of each element has a weight peculiar to that element, referred to the weight of the hydrogen atom as **unity.**

Molecular Weight—The molecular weight of a substance is equal to the sum of the atomic weights of the elements of which it is composed. These elements combine in **fixed proportions**, which are determined by the number of atoms that saturate each other or the **"valences"** of the elements.

Valence or Valency—The valence of an element is a term used to express its **combining power** in relation to the number of atoms of hydrogen (the assumed **unit**) or its equivalent required to satisfy the affinity. For example, two atoms of hydrogen are required to saturate a single atom of oxygen, and the valence of hydrogen being one, the valence of oxygen is two. The reaction is expressed by the chemical equation

$$2\ H_2 + O_2 = 2\ H_2O.$$

There are many elements, however, that do not unite with hydrogen and to determine their valency it is necessary to compare them with other elements that combine with them and whose valence is known. For this purpose the elements **oxygen and chlorine** are most convenient. The valence of oxygen, as shown above is **two.** The valence of chlorine is **one,** since one atom of hydrogen completely saturates one atom of chlorine.

$$H_2 + Cl_2 = 2\ HCl.$$

The element calcium combines both with oxygen and with chlorine but not with hydrogen alone. Its valence is two as shown by the following equations:

$$Ca_2 + O_2 = 2\ CaO$$
$$Ca_2 + 2\ Cl_2 = 2\ CaCl_2.$$

The **valence** of most elements is **not absolute** but changes, often by two and frequently by successive units. For example, calcium has a valence of two and four; gold, one and three; copper, one and two; iron, two, three, four and six; while nitrogen forms the following series of oxides:

$$N_2O,\ N_2O_2,\ N_2O_3,\ N_2O_4,\ N_2O_5.$$

Classification of Elements by Valence—Owing to the change in valency exhibited by many elements it is not possible to make an unvarying classification in this respect. For the sake of convenience, however, many of the elements are designated as **univalent, bivalent, trivalent, quadrivalent,** etc.; or as **monads, dyads, triads, tetrads, pentads, hexads,** etc., according as they exhibit valencies of one, two, three, four, five, six, etc., in combining with other elements.

The Coal Age Pocket Book

A Chemical Compound—A chemical compound is a substance composed of molecules formed by the chemical union of two or more unlike atoms. In a chemical compound the elements are always combined in **fixed proportions** and the substance has fixed properties that are always the same.

A Mechanical Mixture—A mechanical mixture is composed of unlike substances mixed together in any proportion and not chemically combined. The properties of such a mixture vary with the kind and proportion of the substances of which it is formed.

The **atmosphere** is a mechanical mixture of oxygen and nitrogen. Although the proportion of these gases is practically always the same in pure air, the gases are only mixed and do not combine with each other.

Acids, Bases and Salts—Chemistry considers three general classes or conditions of matter, which make the substance either an acid, a base, or a salt.

Briefly and plainly stated, an **acid** is a substance that dissociates in aqueous solution yielding hydrogen ions.

A **base** is a compound capable of reacting with an acid to produce a salt. It is an alkaline metallic oxide.

A **salt** is a generally neutral compound formed by the union of an acid and a base.

In general the **nature of an acid** is the direct opposite to that of a base. In combination they neutralize each other, forming a neutral salt and water. The **distinguishing characteristics** of all acids are: 1. The sour taste. 2. The turning of blue litmus red. 3. The evolution of hydrogen by contact with a metal.

A number of acids are formed by the direct union of hydrogen with another element; as hydrochloric acid (HCl); hydrogen sulphide (H_2S). Other acids are formed by the union of two radicals—the hydrogen radical or hydroxyl (HO) and an acid radical; or they may be considered as the result of the addition of water (H_2O) to an anhydrous acid (anhydride).

In the first instance, the formation is as follows:

Hydrogen radical (hydroxyl)	$2(HO)$
Acid radical	SO_2
Sulphuric acid	H_2SO_4

Or, again, the formation may be regarded thus:

Water	H_2O
Sulphuric anhydride	SO_3
Sulphuric acid	H_2SO_4

Oxides—Nearly all the elements unite with oxygen to form oxides, but the affinity for oxygen is stronger in some cases than in others. When the affinity of the elements for each other is strong the compound formed is more stable than when the affinity is weak.

A **monoxide** is formed when the molecule contains but one atom of oxygen; as for example, carbon monoxide (CO).

A **dioxide** is formed when the molecule contains two atoms of oxygen, as carbon dioxide (CO_2).

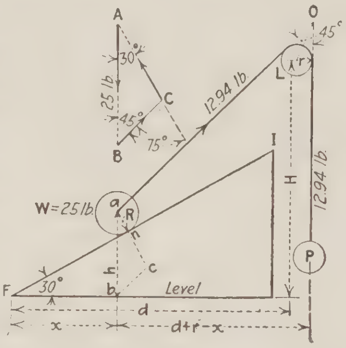
A **trioxide** contains three atoms of oxygen.

Inquiries of General Interest

A Question in Mechanics

There is an interesting problem in regard to balancing a given weight on a plane having a given inclination, which has excited considerable interest and I would like to see the same answered in Coal Age. The question is as follows:

Referring to the accompanying figure, find what weight or downward pull P will support a weight $W = 25$ lb. on an incline making an angle of 30 deg. with the horizontal when the pulley L is at such a height H above the foot of the incline that the rope supporting the weight W and running over the pulley L is not parallel to the incline. It will be observed that the ratio between the weight W and the balancing pull P is not constant, since the angle that the rope makes with the incline constantly changes, according to the position of the weight on the incline.



J. R. L.

Seattle, Wash.

As correspondent states, the angle that the rope makes with the incline is constantly changing. For this reason it is impossible to get any simple expression for the ratio of the weight moving on the incline to the balancing pull.

Referring to the accompanying figure, let FI be the incline on which the weight W (25 lb.) is supported by the rope that passes over the pulley L, the balancing weight being shown at P. Assume the radii of the weight, ball or wheel W and the pulley L to be R and r, respectively. Call the horizontal distance from the foot of the incline to the center of the pulley d, and the horizontal distance from the foot of the incline to the center of the weight x. Then the horizontal distance from the center of W to P is $d + r - x$.

Now, it is possible to find the distance x, which determines the position of the weight W, for any assumed angle that the rope makes with the vertical or the angle of contact on the pulley. For example, taking the angle of contact on the pulley as 45 deg., as indicated in the figure, the horizontal distance from the foot of the incline to the center of the weight or the distance x is found by applying the principles of geometry; thus,

$$x = (d + r) - \left[H - h + \frac{r}{tan\ \frac{1}{2}\ (45°)}\right] tan\ 45°$$

But, since the tangent of 45° = 1 and tan ½ (45°) = tan 22° 30′ = 0.414, and assuming the following values, which are known or can be found: $H = 64$ ft., $d = 75$ ft., $R = 5$ ft., $r = 4$ ft., we have, by substituting these values in the above equation,

$$x = (75 + 4) - \left(64 - h + \frac{4}{0.414}\right) = 5.34 + h$$

But by the principles of geometry

$$h = \left(x + \frac{R}{sin\ 30°}\right) tan\ 30°$$

$$h = \left(x + \frac{5}{0.5}\right) 0.577 = 0.577\,x + 5.77$$

Then, substituting this value of h in the previous equation, we find for the value of x

$$x = 5.34 + 0.577x + 5.77$$

$$x(1 - 0.577) = 5.34 + 5.77$$

$$0.423x = 11.11$$

$$x = \frac{11.11}{0.423} = 26.26 \text{ ft.}$$

Finally, to find the distance Fn (see figure) measured on the incline from its foot to the weight W, we have

$$Fn = \frac{x + R \times sin\ 30°}{cos\ 30°} = \frac{26.26 + 5 \times 0.5}{0.866} = 33.2\ ft.$$

The weight required to balance 25 lb. in this position on the incline is now found from the triangle of forces ABC, shown in the figure, and which corresponds to the triangle abc indicated just below it on the incline. In the triangle of forces ABC, $AB = 25$ lb., and the angles are $A = 30°$, $B = 45°$, while the external angle C is equal to the sum of the other two interior angles A and B, or 30 + 45 = 75 deg. The side BC, drawn parallel to the rope supporting W, represents the pull required to balance that weight in this position on the incline. Hence,

$$BC = AB\frac{sin\ 30°}{sin\ 75°};\ \text{or}\ P = W\frac{sin\ 30°}{sin\ 75°}$$

$$P = 25\,\frac{0.5}{0.966} = 12.94\ lb.$$

This problem although interesting is of value only as a mathematical drill.

⁂

An Electrical Question

Assuming that a man is in contact with a live wire and it is necessary to short-circuit the current in order to rescue the man, should this be done between the man and the power station or just beyond the man; or will it make any difference?

A. P. Caudell.

Hannastown, Penn.

The current may be short-circuited with practically the same result on either side of the man, but as close to him as practicable. The small resistance represented by the short length of trolley wire between these two points is so slight comparatively that it is negligible. It is more important to make the short-circuit as quickly as possible at the most convenient point close to the man.

Connellsville—The Connellsville coke trade shows a production and output decidedly increased from previous figures. The production and shipments recently reached 305,000 tons, being a record for the present year. One thousand four hundred idle ovens were recently fired, most of which were non-productive until the present.

Uniontown—The H. C. Frick Coke Co. has fired 1090 ovens since May 20. This firm has been operating on a 63 per cent. basis, but for the last two weeks has been working its men six days each week. It is understood that a stock of coke is being accumulated.

Quemahoning—M. L. Reiman and Luther T. Gardner, of Johnstown, have secured options from 25 farmers of Quemahoning Township, Somerset County, for something like 3000 acres of coal lands, which they expect to dispose of to Raymond Havemeyer, of the American Sugar Co., who recently inspected the tract. The tract extends from Quemahoning Dam site to Stoyestown and Hooversville and adjoins the property owned by the Federal Coal Co., the Quemahoning Coal Co. and the Randolph Coal Co. It is possible that the deal will be consumated within the next week or so when a corps of engineers will be put to work on the tract. It is said that Mr. Havemeyer has an option on some 500 acres of coal located near the Quemahoning Dam that adjoins the property about to be taken over.

Scottdale—Arrangements have been made for reopening the Strickler Works, in Mt. Pleasant Township, Westmoreland County, after a complete shutdown of many months. The plant is owned by J. A. Strickler, banker and coal operator of Wilkinsburg, Penn.

Bentleyville—The Pittsburgh Westmoreland Coal & Coke Co. at this place is constructing a new and uptodate lamp house on the foundation of the one recently destroyed by fire and explosion. The new structure will be of brick and concrete and will be thoroughly fireproof. New equipment will be installed.

WEST VIRGINIA

Huntington—May was one of the greatest coal loading months in the history of the Chesapeake & Ohio R.R. Up to the 28th of the month 1,797,590 tons had been loaded, and it is believed that when figures are all in they will show that over 2,000,000 tons were shipped. During the first half of May 16.3 per cent. more coal was taken out of the field than during a corresponding period of last year, and this with a reduction of 6.2 per cent. in the railroad pay roll.

Wheeling—Andrew Ferari, of Wheeling, recently appeared by counsel before Judge Robert M. Addleman and asked for a receiver for the Parisian Coal Co. in which he is a partner. The judge postponed action until the opening of the June term of court, and suggested that in the meantime the partners get together and compose their difficulties.

Bluefield—The entry of Italy into the European war is already having its effect in the coal operations throughout the Norfolk & Western territory, and it is feared that the departure of many of these men will seriously cripple operations which have been retarded for several weeks on account of a scarcity of labor. It is believed that one-fourth of the coal miners employed in this field are Italians, 45 per cent. of which are of the reservist class.

TENNESSEE

Knoxville—The Tennessee Legislature has just passed an act that provides for removing 500 of the 800 convicts from the state mine and coke ovens during the summer months and working them on the roads. This will tend to make better roads and less competition in the coal market when there is practically no demand for large quantities of coal. The 300 convicts kept at the mine during the summer are considered to be what is sufficient only to keep the plant in proper working condition and keep up with what contracts have to be filled in the summer months. This operation is what is commonly known as the Brushy Mountain mine and is located near Petros, on the Harriman & Northeastern R.R., which is operated by the Queen & Crescent. A few of the convicts have already been put to work on the roads near Petros, and the balance of the 500 will be taken from the mine as fast as the necessary equipment can be provided for working and caring for them on the roads throughout the state and contracts made with the various counties to use them.

OHIO

Bellaire—Four hundred more coal miners will go to work when the Pultney mine of the George M. Jones Co., south of the city limits, starts operation after an idleness of 14 months. Machine men are now in the mine preparing for the resumption of work. This mine is one of the largest in this section of the country.

Flushing—Seventy-five miners employed in the Tunnell mine were imprisoned recently when the timbers at the pit mouth gave way, allowing the entry to fall in. The men escaped through an air shaft a mile distant. The timber supporting the pit mouth had decayed badly during the 14 months' strike, and finally gave way.

Columbus—New mining safety problems confront State Mine Commissioner John M. Roan as the result of the prospective opening of eastern Ohio mines, which have not been worked for more than a year, the longest period of idleness in the state's history. Commissioner Roan is making a thorough survey of the every mine before permission to resume operations is granted. Most mines will not start for a week or more it is said.

INDIANA

Indianapolis—The Supreme Court of Indiana, in a case in which the Jacksonville Coal & Coke Co. was interested recently decided that a mining company must leave sufficient support in a mine for the soil above although it is not required that the support be sufficient to carry heavy buildings placed on it by the owner of the surface. The suit was for damages because the land settled owing, it was alleged, to the negligent manner in which the coal was mined underneath.

ILLINOIS

Lincoln—A receiver has been appointed for the Latham Mining Co. of Lincoln, following a foreclosure suit filed by the Sangamon Loan & Trust Co. The mining company has failed to redeem a large part of $60,000 bonded indebtedness.

Dunfermline—The operation of the Dunfermline mine of the Big Creek Coal Co. was assured for several years by the closing of leases on 550 acres of land. These leases were recently consummated and the shortest of them runs for 15 years.

FOREIGN NEWS

Nanaimo, B. C.—Volunteer rescuers on May 28 entered the lower workings of the Reserve mine of the Western Fuel Co. in search of the bodies of 19 miners who were entombed on the night of May 27, by an explosion of gas. The bodies of three miners were recovered as well as a fourth man who was so badly injured that he is not expected to live. Scant hope was entertained that any of the entombed men could be rescued alive, and the mine officials turned their attention to restoring the system of ventilation.

PERSONALS

C. C. Scott has been named to succeed E. E. Russell as mine foreman at Flat Top mine, the appointment having been made by Governor Henderson recently.

George M. Isaacs, who was formerly with the W. J. Hamilton Coal Co. and its successor the Maple Hill Coal Co. for 11 years, has taken a position as Indiana salesman for the Pocahontas Coal Sales Co. of Detroit.

W. D. Roberts, of Huntington, W. Va., has written a book entitled "Logan County Coal." The reason for this production is to further a campaign of education among the large users of coal to the economic necessities that the producer should be paid a better price.

Richard Krapf, outside foreman at the Phoenix Park Colliery of the Philadelphia & Reading Coal & Iron Co., has resigned his position to become coal inspector of the sales department of the Maderia-Hill Co. He will be connected with the Pottsville offices and will make his residence there.

W. H. Clingerman, president of the H. C. Frick Coke Co., recently received a painful injury in one eye, while returning to Scottdale from one of the mines, in an automobile. A branch of an overhanging tree whipped against Mr. Clingerman's face with great force, and one eye was seriously cut. His physicians have ordered complete rest for both eyes during several days.

R. A. Shiflett, better known in the mining regions of East Tennessee as Bob Shiflett, recently received from the Governor his commission as chief mine inspector, succeeding George Sylvestor, appointed four years ago. Mr. Shiflett served in the capacity of mine inspector for a four-year term under McMillim. Again a similar term during the Frazier administration, and still again under ex-Governor Patterson.

Merton A. Pocock has been appointed district sales manager for the territory included in the States of Minnesota, North Dakota and South Dakota by the Terry Steam Turbine Co. His office is 400 Endicott Building, St. Paul. This arrangement supersedes the previous selling agreement with Robinson, Cary & Sands Co. of St. Paul.

The above company has also appointed the Hawkins-Hamilton Co., People's National Bank Building, Lynchburg, Va., its representatives for the State of Virginia.

OBITUARY

Frank Hopkins, of Sebastopol, an assistant mine foreman for the Pennsylvania Coal Co., died recently at Pocono Pines, where he had gone some weeks ago for the benefit of his health. The body was returned to Sebastopol for interment.

J. C. Hayden, of Jeansville, Penn., died May 27 of apoplexy, at the age of 81 years. He had been ill for the past year from heart and kidney trouble. Mr. Hayden was a pioneer anthracite coal operator, but sold his mining property to the Lehigh Valley Coal Co. years ago. He was the founder of the Jeansville Iron Works, which is now controlled by the International Steam Pump Co.

Reese Tasker, general inside superintendent of the Philadelphia & Reading Coal & Iron Co., died at his home on George St., Pottsville, on the afternoon of May 31, from the effects of a stroke of paralysis. He was prominent in mining circles for nearly a half century, his knowledge of the inside workings of the 55 collieries of the Reading company making him a highly valued man, whose loss, the officials say, will be difficult to replace.

Andrew Jackson Reilly recently died in the office of Dr. U. J. W. Peters in the Empire Bldg., at Birmingham, Ala. Mr. Reilly came to Birmingham about 30 years ago from Philadelphia to take the position of chief engineer with the old Ramsey & McCormack Coal & Iron Co. He remained with the concern for about 15 years, and then opened an office in Birmingham as consulting mining engineer. He later bought the Fairchilds Coal Co. of Inland and until the time of his death was actively engaged in the management of this concern of which he was the owner.

RECENT COAL AND COKE PATENTS

INDUSTRIAL NEWS

Bicknell, Ind.—The American Coal Mining Co. has just given the Link Belt Co. an order for additional equipment for its mine at Bicknell, Indiana.

Uniontown, Penn.—Decisions in the petitions for leave to file suits against J. V. Thompson and others now in the hands of receivers will not be handed down by Judge J. Q. Van Swearingen before June 15.

Lexington, Ky.—The Kentucky River Coal Corporation, a leasing company recently formed by the consolidation of the Haley Coal Co., the Slemp Coal Co., and others, has established headquarters at the Fayette National Bank Building, Lexington.

Columbus, Ohio—The Ralston Steel Car Co., of Columbus has secured a contract from the Pennsylvania R.R. Co. to build 1000 all-steel hopper cars for coal traffic. The Ralston company is just completing a 200-car order from the Baltimore & Ohio R.R. Co.

Roundup, Mont.—The Roundup Coal Co. has placed an order with the Link-Belt Co. for a complete tipple and screening equipment. This company is the designer, engineer and manufacturer of the entire equipment, the cost of which will be approximately $25,000.

Uniontown, Penn.—The injunction hearing of the Rainey company against D. J. Johnson and C. W. Johnson to restrain them from drilling through the Rainey workings at Percy which was to have been heard before the court May 18 was continued until June 22 by agreement of counsel.

Washington, D. C.—Rates on bituminous coal from the Crooksville, Ohio, coal district to Chicago and points in Illinois, Indiana and Michigan, were recently pronounced unjustly discriminatory by the Interstate Commerce Commission as against rates from mines in the middle district of Ohio.

Charlestown, W. Va.—William L. Connell, president of the Paint Creek Colliery Co., was recently named as its receiver on a petition of a Scranton, Penn., banking house. Liabilities are given as $100,000. This company operates one of the most important coal developments in the Kanawha field.

Kansas City, Kan.—The new automatic coal and ash handler which was recently installed in the municipal plant at Kansas City, Kan., was set in motion May 19. The change from handling coal through the old carrying, hauling and shoveling methods it is estimated will save the city $5000 a year in operating expense.

Youngstown, Ohio—The Republic Iron & Steel Co. has awarded a contract for the construction of storage bins at its new byproduct coke plant to the McClintic-Marshall Construction Co., of Pittsburgh. The job will call for 600 tons of structural steel. The bins will be used for the storage of the coal required in the operation of the plant.

Chattanooga, Tenn.—The byproduct coke plant at Alton Park is almost completed, and fires have been lighted under a battery of the coke ovens. The production of coke in large quantities will begin during the present month. Gas is now being used from the Chattanooga mains, but as soon as the ovens are brought to the proper temperature, gas will be supplied to the city.

Seattle, Wash.—After a controversy lasting nine years, the government has finally issued a patent to Morris A. Arnold, president of the First National Bank of Seattle, for a claim in the Bering River coal field of Alaska. The claim is one of three located in 1906. Over $150,000 was spent in developing the property, and then all work was stopped by an order from the government.

Carrolltown, Penn.—The Jacob C. Steinman Estate has reecntly closed a deal for the purchase of coal under 145 acres of the Henry Shaffer farm in Conemaugh Township. This tract adjoins the present coal holdings of the Steinman Estate. It will be mined from the Southport operation, and will not necessitate a new opening. The consideration was approximately $28,000.

Juneau, Alaska—After five years, the government has decided to drop the indictments against Cornelius Christopher and George Simmons, who were charged with having attempted to obtain possession of Alaskan coal claims by fraudulent methods. Many others who have been indicted under similar circumstances have been dismissed on the grounds that there was no evidence of fraud.

Greensburg, Penn.—Jos. Owens, W. H. Owens and J. & C. Owens, residents of Westmoreland County, have sold to Thomas Bowman, of Manchester, England, three tracts of coal land in Allegheny township for a consideration of $11,000. The deed dated Apr. 28 gives the purchaser only the right to mine the vein termed the Upper Freeport and reserves all lower measures to the parties of the first part.

Columbus, Ohio—The Chesapeake & Ohio directors have approved the trackage agreement with the Norfolk & Western by which the Chesapeake & Ohio will use 62 miles of track between Waverly and Columbus in connection with the Chesapeake & Ohio's recently announced plan to build a line to connect with the Hocking Valley. Work has been started on a 28-mile section of track to run from Sciotoville to Waverly.

Johnstown, Penn.—For the first time since the early part of November, 1913, the Cambria Steel Co. will be operating eight blast furnaces in the immediate future. Two additional openhearth furnaces are being heated up at the Franklin plant, making a total of 27 openhearth furnaces to be placed in use. Many additional men are being given work but the labor situation is not expected to regain its normal conditions for some time to come.

Red Lodge, Mont.—The case of the Bear Creek Coal Co. and the Montana Coal & Iron Co. against the Montana, Wyoming & Southern R.R., which was heard before the state railroad commission last December has been settled in favor of the defendant. The coal companies were attempting to secure a combination of rates that would permit them to compete with the mines of the Roundup Coal Co. along the right-of-way of the Chicago, Milwaukee & St. Paul R.R.

Baltimore, Md.—On May 25, nine vessels were in line at the coal piers of the Baltimore & Ohio R.R. at Curtis Bay, and at those of the Western Maryland Ry. at Port Covington either being loaded or waiting their turn to get under the chutes to take cargo. This is as large a number as has gathered here in one day for some time. It shows that the work of exporting coal is fast growing and bears out the prediction that there would be an active foreign demand for American fuel.

Uniontown, Penn.—Deeds conveying the coal underlying 36 lots in Mount Pleasant, Westmoreland County, have been recorded at Greensburg. James A. Braddock, of Mt. Pleasant, bought this coal and transferred it to the Frick interests, receiving in return an equal amount from the Frick field adjoining his Franklin plant in Fayette County. While the majority of sellers are private property owners the transfer also includes the coal under the Mt. Pleasant Seminary and the Baptist church.

Connellsville, Penn.—It has been announced that the experiments of the H. C. Frick Coke Co. looking toward the profitable extraction of sulphuric acid and iron oxide from the mine water at Davidson will be discontinued because of the cost of operation, this being greater than the value of the product secured. The experiments demonstrated that these products might be extracted from the mine water, but the cost of operation was such as to render the scheme commercially impracticable.

Washington, D. C.—The Supreme Court on June 1 affirmed the Interstate Commerce Commission's order reducing coal rates to Nashville, Tenn., and giving switching privileges to the Louisville & Nashville R.R.'s competitors. The commission ordered the Louisville & Nashville and the Nashville, Chattanooga & St. Louis railroads' coal rates reduced to 20c. per ton from western Kentucky, eastern Tennessee and Alabama. It held these rates were unreasonable as compared with those given Cincinnati and other cities.

Pittsburgh, Penn.—J. A. Paisley, of Cleveland, recently entered a suit against the Rail & River Coal Co. asking $339,000 commission fee from the defendant company and its officers. He alleges that he was retained to sell properties of the Rail & River Coal Co. and to receive therefor a commission of 10 per cent. That the properties were sold to the Grand Trunk Development Co., of Toronto, Canada, for $3,390,000 and the sale was made through Charles M. Hayes, of Toronto, Canada. This case was tried once before, but the jury disagreed.

Uniontown, Penn.—Announcement was made May 28 by George Whyel, president of the Consolidated Connellsville Coke Co. that a shipment of 4500 tons of Fayette County coke would be made to Argentina for experimental purposes in an effort to find a substitute for the German byproduct coke that has been used exclusively in South America. Should the test shipment of coke prove satisfactory, it is certain that the Fayette County coke region will feel the effects of a more steady and permanent demand for its staple product. The shipment will be made from Baltimore.

Spokane, Wash.—The public service commission has accepted a compromise in coal rates in Washington. In connection with Roslyn coal rate to Spokane being reduced to $2.25 a ton, a movement is on foot to have still maintained the 35c. differential rate from the Crows Nest Pass coal field which includes the Crows Nest, Corbin and Bellview mines. The present rate of these Canadian coals is $2.15 and the former rate on Roslyn coal was $2.50, thus if a 35c. differential rate is maintained by the Canadian mines, the rate will be $1.90 a ton to Spokane. The matter has been taken up with the railroad companies.

Brookville, Penn.—The Dilltown Smokeless Coal Mining Co. has filed complaint with the Interstate Commerce Commission against the Pennsylvania R.R. and the Buffalo, Rochester & Pittsburgh R.R. Co., charging discrimination against the Dilltown company in favor of its competitors. It is alleged that the Buffalo, Rochester & Pittsburgh road furnishes other coal companies with plenty of empty cars while it refuses to give to the Dilltown company enough for its purpose. It is charged that the Pennsylvania exacts a rate of $1.25 a ton from the Dilltown company on shipments to Buffalo, N. Y., and carries the coal of its competitors for $1.10. These discriminations the commission is asked to stop.

Toronto, Canada—The application of the railway companies to the Canadian Railway Commission for permission to increase the freight charges on coal 10 cents per ton is now being considered by the Commission. A hearing was given at Ottawa recently to the representatives of the Toronto coal dealers and the Consumer's Gas Co., who presented arguments against the proposed increase. Figures were presented showing that at present it costs much more for freight and customs duty on a ton of bituminous coal f.o.b., Toronto, than the actual cost at the mines. It was stated that bituminous coal can be bought at the Pennsylvania mines a $1.30 per ton. The freight rates from the mines to the International Bridge at Niagara Falls is $1.25 and from that point to Toronto 60 cents per ton. The ordinary customs duty is 53 cents and the war tax 10 cents making the total cost at Toronto $3.78. It was contended on behalf of the railways that latterly their expenses had increased enormously but that their revenue was not increasing proportionately. The case is still pending.

Coal Trade Reviews

General Review

Anthracite continues to slow down and price cutting becoming more general. Bituminous agencies are still optimistic though concern is felt over the prevailing low prices.

The current season has witnessed a large falling off in the number of anthracite consumers stocking up at the minimum circular of the year. The difficulty in making satisfactory collections, because of the uncertainty in financial circles is largely responsible for this, the retailers hesitating to push for business on which payments are liable to be long delayed. The market is also badly unsettled because of the low prices, there still being persistent rumors that the large companies are participating in the price cutting, some having openly quoted pea coal at 50c. off the circular. A compensating feature of the situation is the undoubted fact that there must be a tremendous rush in the fall business in order to overcome the deficiency now being developed. While shipments up the Lakes have been maintained in a normal volume so far, the movement out from the Upper Lake ports has slowed down and coal is beginning to back up into the shipping ports at Buffalo.

Aside from the heavy movement in the export trade, the bituminous market has seldom ever been so devoid of interest. The large off-shore business has stimulated some slight interest among local buyers and shippers are confident of a firmer market before very long, while there are some large orders coming up for consideration during the current month. On the other hand there is some concern being expressed over the trend of the market, due to the low prices being quoted on some large city contracts, which have been closed at the minimum figures for a number of years.

An occasional temporary spurt creates renewed hope among Pittsburgh shippers, and the situation averages up as monotonously dull as ever, although the fact that the trade has held its own since the resumption of mining in Ohio is an encouraging feature. The possibility of a labor shortage, due to the extremely light immigration since the inception of the European war, combined with an abnormal exodus of miners leaving to participate in the trouble, is being used to boost the market, but well-informed observers see little hopes for any relief in this direction, so long as the demand is so restricted. Regular circulars are generally maintained, but as is always the case in a dull market, there is more price cutting than normally. No important movement in the Lake trade is anticipated before July. The exceedingly low prices prevailing in the open market are still interfering with negotiations on new contracts in Ohio, and with one of the most important companies announcing it will not start Lake shipping before July 1, the outlook is still discouraging.

One of the most encouraging features in the Middle Western situation is the fact that shippers are effectively curtailing production so that the market is free of demurrage coal. Agencies continue optimistic regarding the future, but the current movement is light, while the situation is further aggravated by poor collections. The recent cool weather has increased the demand slightly and helped mine operations.

BUSINESS OPINIONS

Boston News Bureau—Every day seems to increase confidence in the financial and commercial position of the United States. This is the result of the European war. It looks now as if we should have a foreign trade balance something like $1,000,000,000 June 30, the close of the fiscal year. Against this, including interest on American securities, tourist expenses, freight charges and all other possible offsets, there will remain a net trade balance of fully $500,000,000. The brightest minds see in our remarkable position a situation calculated to arouse the greatest amount of courage and enthusiasm. It must stimulate the initiative. The fact is that this country is making such enormous strides that even our troubles with Germany and Mexico cannot absolutely check the benefit.

Bradstreets—Cool, wet weather over a wide area has reduced retail trade in seasonable goods; pending international political matters, though not given much prominence, make for caution in financial circles, and winter wheat and corn crop reports are not so glowing as heretofore. On the other hand, the larger distributers of staple articles seem to be doing quite well; mail-order trade is large; manufacturing certainly is more active; complaints of a scarcity of skilled mechanics are numerous; business in war materials is rushing; ship-building yards are filled with orders; railway traffic is heavier.

Iron and Steel—The record prices obtained for spelter have made startling changes in the prices of finished galvanized products. An increase of $10 per ton has been made in galvanized pipe and an increase of $5 in galvanized sheets follows one of $7 a ton less than a month ago. Foreign business continues large but there is getting to be more and more difficulty in securing freight room. At the meeting of the Iron and Steel Institute held in New York last week the leaders of the industry spoke enthusiastically about the prospects for business. Rail orders have been larger but the 135,000-ton order of the Pennsylvania has not yet been placed. Sales of steel making iron have been made in Pittsburgh at slightly higher prices. The steel industry as a whole is operated at 75% of the maximum capacity.

Dun's — Steadily expanding industrial operations — due mainly, but not wholly, to the big war demands—have a stimulating effect generally, although the many uncertainties of the foreign situation make for caution everywhere. Hesitancy in new enterprise, however, does not imply any lack of confidence in the future, but rather a disposition to await further developments in regard to this country's diplomatic relations with Germany.

Marshall Field & Co.—Despite unseasonable weather for dry goods distribution, current wholesale shipments are about the same as a year ago. Sales by our traveling organization show an increase over those of the corresponding period last spring. The continued disposition of retailers to anticipate their future sales requirements is resulting in a good volume of fall business. The daily average of buyers in the market has been considerably larger than last year.

Engineering News—The ability of business to withstand the severe shocks which occurred during May, indicates clearly the firm foundation which underlies the general structure. Although the newspapers in the United States are calling attention to the dire possibilities that might result from international complications, there has been no postponement of business already under way—no engineering contracts, as far as can be learned, have been postponed for this reason—and while there was a temporary halt in the volume of new business, this has almost all disappeared and increased activity is making steady headway. As far as the general business situation is concerned, it was better on June 1 than on May 1. More men are at work, more projects are planned, and there is more confidence that business this year will show a steady gain. Contracts for certain commodities have been made for delivery well into 1916, and the business world is taking a long look ahead.

ATLANTIC SEABOARD

BOSTON

Buyers show more interest in market. Export demand tends to harden prices. Less "market coal" and better conditions on cars. Georges Creek in good position. Anthracite shippers have a supply of June orders.

Bituminous—All the agencies are still talking confidently of a firmer market and there is more interest on the part of buyers than for two months. There has not been any buying of consequence but there are likely to be some good-sized orders placed during the current month. Meanwhile, the export business is helping to keep down accumulations at the Hampton Roads and Baltimore piers. The latter port is having its full share of the off-shore business and when clearances are too slow for coastwise boats the shift is made to

Norfolk and Newport News. In this way, all interests are deriving some benefit from the foreign demand. Prices are not changed from last week but there is a little more life to the market, $2.75@2.80 is now about the lowest price at which standard Pocahontas and New River can be had.

"Market cargoes" are less in evidence here and the on-car price is somewhat firmer; $3.70@3.75 is now the ruling price on small lots for delivery inland. In some quarters there is beginning to be some concern over the possible trend of the market next winter. This is particularly true in the local city market where prices have lately been the lowest in years on account of certain local complications.

The output of Georges Creek is still being confined largely to Baltimore for foreign tonnage but small consignments are coming forward via Philadelphia and New York. There is practically none of this grade available for spot shipment and each cargo arriving here has a consignee awaiting it.

There is a slight improvement noticed in the demand for the better Pennsylvania grades, due in large part to the better situation on the Southern coals. No strengthening in prices is apparent as yet but as the market at Hampton Roads gets firmer there is naturally more interest in the Cambrias and Somersets that compete under such conditions.

Water Freights have so far shown no firmer tendency; it is easy to charter at 75c. Hampton Roads to Boston, on barges 1500 tons and upwards. On Long Island Sound the minimum rate of 40c. still prevails for New York loading.

Anthracite—The curtailment is showing results. Several of the companies have carried orders over into June. While barges are not all in use there is a fairly constant movement, especially from Philadelphia. Some of the smaller shippers are just now clearing cargoes on which there was some assurance of April loading. Dock screenings continue in short supply but steam sizes are everywhere available for spot shipment.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.75@2.85
Boston†	....	....	....	3.70@3.78
Providence†	....	....	....	3.60@3.73

* F.o.b. †On cars.

PHILADELPHIA

Anthracite very dull over the month end. Mining operations restricted and trade badly unsettled. Price cutting spreading to the leading companies.

Anthracite—The last week of May opened with little prospect of increased tonnage. However, a cool spell unprecedented in the annals of the weather bureau stimulated a few orders. Outside of this the trade shows a tendency to lag more than is usual even at this dull period of the year. Many of the collieries continue on short time and the indications are that the working schedules will soon be even more restricted.

Retail dealers complain of poor collections, which has resulted in their not pushing sales of domestic sizes for delivery at this time. The market continues badly unsettled by the low prices prevailing; it is even being suggested that some companies, long known for their rigid adherence to the regular circular, have deviated from their usual course in this respect.

Retail dealers are strongly averse to stocking up at the low prices and many of them openly state they have good reason to believe they will be able to buy two or three months from now at prices as low as the present and possibly lower.

Stove coal seems to be in the most active demand. Broken is well taken care of, as most of this size is sold on contract to large consumers such as gas companies, iron manufacturers, etc., and it is feared in some quarters that it will be very difficult for some operators to fill their contract orders on this size owing to restricted mining. The demand for egg is weak, while chestnut, along with pea and the other small sizes, are going begging. The large companies are asking $2 for pea although the circular price is $2.50, but the individuals are making sales at 15c. to 25c. under the $2 figure, and it is noted in at least one instance where pea has sold for as low as $1.60.

Considerable interest is centered this week on the bids for supplying coal to the public schools; bids are requested on about 37,000 tons of pea and 19,000 tons of prepared sizes. The price at which this coal is taken is always interesting and it is feared in some quarters that certain dealers who are becoming especially noted for low prices, anticipating a particularly dull summer, will take the business without profit, being content with a hauling charge to keep their equipment in action. There was also a rumor abroad that some of the large mining companies would bid on the business direct, as was their custom some years ago, but it is not likely that this will eventuate.

The prices for June have just been issued and there will be the customary advance of 10c. per ton on the prepared sizes, which makes the prices for delivery this month as follows:

	Line and City	Tide
Broken	$3.20	$4.45
Egg	3.45	4.70
Stove	3.70	4.70
Nut	3.85	4.95

NEW YORK

Some accumulation at New York Harbor and bituminous market maintained with difficulty. Anthracite dealers stocked up and mine operations much restricted. No improvement anticipated before fall.

Bituminous—Increased demands by contract holders has aided the soft coal situation materially and conditions are better than in some time. There has been a slight improvement over last week, much of which is attributed to the demands on American manufacturers from the countries engaged in the European struggle. A stronger market is looked for with better prices.

While operators are endeavoring to keep shipments within the consumption, the docks in New York harbor continue to be well stocked, but the surplus coal has not been sufficient to cause any serious trouble. The mines in the Central Pennsylvania and Pittsburgh districts are working a trifle better. Operators in the southern West Virginia and Kentucky regions are experiencing some labor trouble. Car shortages continue on some of the railroads but are not serious enough to cause any extended trouble. The bunkering business has improved some while shipments to New England points have increased.

Demurrage coal is scarce. The demand for spot coals has not been active. Some job lots of good Pennsylvania coals have gone at $2.40 to $2.45.

The export demand continues to be the feature of the market. With inquiries increasing shippers are having trouble in getting bottoms. Few boats are to be had and rates have stiffened. An inquiry has come from Spanish interests for 100,000 tons, and a crucible company in Italy is reported to be in the market for American coals, willing to take a few cargoes on trial. It is also stated that the Swedish railways have about closed negotiations for 300,000 tons at an f.o.b. rate.

Quotations on the various grades are as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	3.00@3.10	3.00@3.10	3.00@3.10	1.45@1.55
Clearfield:

Steam		2.45@2.50	2.45@2.50	0.90@0.95
Western Maryland		2.35@2.45	2.35@2.45	0.80@0.90

Anthracite—The anthracite coal market shows no improvement. Demand has fallen off and no betterment is looked for until fall. Most dealers are stocked up and operations continue slow. Many of the mines are not working more than half time while others are endeavoring to do a trifle better. Advance estimates for May indicate a falling off of about a quarter of a million tons from the shipments of May, 1914.

Individual operators are curtailing their production and it is probable that they will endeavor to strengthen the market by keeping stocks down. Some of their coals were quoted at from 30 to 40c. below companies' circular, but even at those figures there was no rush of buyers. Some of the larger sizes are still quoted at less than April circular.

Nut coal is longest with some shippers and short with others. Stove is generally bringing the full circular. Line trade for these sizes is quiet. The weakness in the steam coals has not improved. Prices remain about the same as last week, with pea coal quoted in odd lots at about $2.75 f.o.b. Buckwheats are in heavy supply with No. 2 in better condition than the other sizes.

Quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.75		$4.80	
Egg	5.00	$4.80	5.05	$4.85
Stove	5.00	4.80	5.05	4.85
Chestnut	5.25	5.00	5.30	5.05
Pea	3.35@3.50	3.10@3.35	3.40@3.55	3.15@3.40

OCEAN FREIGHTS

Freight conditions are practically the same as a week ago and although numerous steamers have been chartered during the interval for export coal, the freight rates paid were about those quoted in our last report. We would quote freight rates on coal by steamer as follows:

To	Rate	To	Rate
Havana	$2.00@2.25	Bermuda	$3.50@3.75
Cardenas or Sagua	3.00@3.25	Vera Cruz	**3.50**
Cienfuegos	2.75@3.00	Tampico	**3.50**
Port au Spain, Trinidad.	3.75@4.00	Rio	8.64@8.76
St. Lucia	3.50@3.75	Santos*	8.88@9.12
St. Thomas	**3.25**	Montevideo	**7.92**
Barbados	3.75@4.00	Buenos Aires or La Plata	8.04@8.16
Kingston	2.75@3.00	Rosario	8.40@8.64
Curacao	3.75@4.00	West Coast of Italy	**10.80**
Santiago	2.75@3.00	Spain**	9.60@10.20
Guantanamo	2.75@3.00	Valparaiso or Callao	**7.20**
Demerara	5.00@5.50	Marseilles	9.60@10.20

Note—Rates noted in **bold face** type are only approximate.
* Consignees paying dock dues. **Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

HAMPTON ROADS

Export movement lighter than anticipated. Prices well maintained. Monthly tonnage large.

Coal shipments foreign have not been so heavy as was anticipated, though the movement coastwise has been fair. The number of bunker steamers calling at Hampton Roads has been normal and in a majority of cases they have taken exceptionally large quantities. The accumulation of coal at Tidewater is still somewhat large but there is quite a large fleet of barges and schooners due which should considerably reduce the tonnage.

Prices on New River and Pocahontas are practically the same as they have been for some weeks although there may be a few cargoes which have been sold at a concession. The government has taken coal during the week some of which was loaded for the Naval Station at San Francisco. The indications are that the dumpings for Hampton Roads ports will not be so heavy as was anticipated during the first half of the month but in any case it is expected they will be close to 1,250,000 tons.

The following vessels have cleared from Hampton Roads during the past week:

Norfolk

Vessel	Destination	Tons
August[1]	Genoa	8079
Songa[2]	La Plata	3788
Mariongo Goulandris	Savona	5084
Mar Cor[1]	Genoa	4950
John B. Biemiller	Canary Islands	1542
Dinnamare[1]	Naples	4904
Woudrichem	Buenos Aires	3304
Thorsa[3]	Manzanillo	1447
Frey[1]	Las Palmas	2100
Den of Crombie	Leghorn	7280
Chiswick	Canal Zone	4800
Catherine V. Mills	Fayal	380
Strathalbyn	Dakar	6750

Norfolk

Vessel	Destination	Tons
Antares	Havana	2837
Geo. E. Walcott	Para	2850

Newport News

Vessel	Destination	Tons
Vesuvio	Genoa	7200
Harald	Barbados	4500
Adelaide Barbour	San Juan	1788
Exford	Marseilles	7500
Italiana	Genoa	3657

Note—Steamers are indicated by **bold face type**, all others being schonners.

[1] Pocahontas Fuel. [2] Northern Coal Co. [3] Castner, Curran & Bullitt.

Railroad Tonnages—Dumpings over the local piers for the past several weeks were as follows:

Railroad	Week Ending May 1	May 8	May 15	May 22	May 29
Norfolk & Western	......	208,179	151,113	162,921	146,462

		341,904	289,061	286,638	291,828

[1] Week ending Friday. [2] Nine days.

BALTIMORE

Anthracite consumers fail to buy at the low-price period. Bituminous exports continue heavy, and May will break all records. Other business continues quiet.

There has been a large falling off in the number of consumers to take advantage of the low schedule of anthracite prices. Buying is confined almost entirely to immediate needs only. Scarcity of money seems to be the chief trouble, although collections have not been particularly bad.

Low grade Pennsylvania coals are offering at 95c. and $1, while the less desirable steam coals of Maryland and West Virginia bring around 80 and 85c. at the mines to the trade. Best coals are being held closer, as they are more fully covered by contracts. Medium grade fuels are offering at from $1.10 to $1.20, with best coals at $1.25 to $1.30.

The following charters were announced the past week:

Vessel	Nationality	To	Rate
Wondricken	Dutch	River Plate	$7.56

LAKE MARKETS

PITTSBURGH

Conditions generally unchanged. Manufacturing demand slightly improved. Operations at 50 to 60% of capacity. No labor shortage feared.

Little, if any, improvement is to be noted in the general coal situation in the Pittsburgh district. Perhaps, however, the trade would be doing well enough to hold its own for the time being, since the general resumption of mining operations in Ohio after the long deadlock. Lake shipments are still far from heavy and not much increase is expected in the near future, though July may see a fairly heavy tonnage. The Lake movement as a whole is practically certain to prove a poor one.

There is no domestic demand to speak of. Railroad requirements have increased slightly, and there has been a barely perceptible increase in the requirements of manufacturing consumers, chiefly in the iron and steel industry. A further improvement in this direction is predicted. Mines continue to operate at an average between 50 and 60% of capacity. While immigration has been extremely light since the war started, and indeed was quite light for a couple of months preceding, there seems to be no possibility of any labor shortage in the coal mining industry in the Pittsburgh district. There is much talk of a prospective shortage in steel mill, blast furnace and coke-oven labor if the trade revives further as is expected.

Mine-run on contracts to Apr. 1 next is largely nominal at $1.15. Free coal is practically unchanged, prices generally being about as follows: Slack, 55@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Very little improvement in bituminous and none at all in anthracite. Every prospect of a light summer. Considerable coal here on track. No really good business till manufacturing starts up.

Bituminous—An occasional jobber will report a little better trade, but as a rule it does not hold. The general opinion now is that there will be no stir of any account till midsummer, if then. At the same time there is no real distress shown anywhere. As is always the case when the volume of business is not satisfactory there is more cutting of prices than there would otherwise be the case but quotations remain at $2.70 for Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. Allegheny Valley sizes are about 25c. lower than Pittsburgh.

Anthracite—The unusual dullness is remarked by everybody. Reports from the Western trade indicate a great part of the coal shipped to that territory this summer will remain on the docks till winter. A liberal amount is moving by Lake, but this is due largely to the difficulties at one dock that has suspended operations once or twice this season by Government order and may be shut down again almost any time on the same account. It is not at all certain that the pace can be maintained, as these shipments are probably more than the Western market will need for the winter. The week's shipments were 96,000 tons.

The local anthracite market is as dull as ever, with no prospect of improvement right away. It appears that the increased amount of independent anthracite in this market has had much to do with the dullness.

COLUMBUS

Domestic and steam business continues quiet and Lake trade is still slow. Difficulty in renewing contracts is still evident.

Operators and jobbers believe that there will be a better demand in the latter part of the year but so far the demand has not come up to expectations.

The domestic trade is still slow but that is expected at this time of the year. Some demand is reported for the fancy grades such as Pocahontas and West Virginia splints. Anthracite is also selling well for this early in the season. Retail prices are generally well maintained at the levels which have prevailed for the past month. On the whole the domestic trade is at a standstill but preparations are being made for a rather active season in July and August. Some demand from the rural districts is expected in the near future.

The steam business is also quiet as manufacturing is still slow. Outside of munitions manufactures, there is only a small demand for steam fuel. Difficulty in renewing contracts is reported on all sides because of the extreme low prices offered in the open market. The railroad demand is not increasing as anticipated.

Lake trade is still slow but it is yet too early for much of a movement towards the Northwest. The Sunday Creek Coal Co. will not start shipments until after July 1. Chartering of boats is slow and charters do not extend for any great length of time. Reports from the Upper Lake ports show a large amount of coal still on the docks.

Some concern is felt over the labor situation in Ohio since the entrance of Italy into the world war. A large number of Italians are leaving for service in the army and it is believed this will have a marked effect on the mining situation in Ohio.

Mining operations are on about the following basis:

District	Week Ended		
	May 15 Per Cent.	May 22 Per Cent.	May 29 Per Cent.
Hocking Valley	25	25	30
Jackson	25	25	20
Pomeroy Bend	50	50	45
Crooksville	25	30	35
Cambridge	35	30	35
Massillon	40	35	35
Eastern Ohio	....	5	15

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.30	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	.70	.75	.65
Coarse slack	.60	.70	.55

TOLEDO

Favorable crop outlook and recent heavy war orders are the features of an otherwise dull market.

Domestic buying is light although aided some by the chilly weather which has prevailed here for the past couple of weeks. There is some demand for threshing coal which will of course increase as the season advances; crops are reported in the best possible condition throughout this section and more than the usual acreage was planted. There is no Pocahontas coal to be had on the local market, especially in the prepared sizes. There is a slight movement of lower grade smokeless coals of which there is a plentiful supply. Pittsburgh No. 8 is not yet much of a factor in the market.

War orders were recently placed in this city amounting to more than a million and a half of dollars, which have forced the enlargement of a couple of local factories and will have a beneficial effect on the market. Cambridge is selling fairly well. Prices are for the most part being well maintained as respects the list although they are at rock bottom. Contracts are still a little slow and the movement of Lake coal continues sluggish. Prospects for a good season later on are considered good and the trade seems content and is doing little worrying.

CLEVELAND

Spot prices rule low and buyers take coal at their own figure. Lake shippers plan to increase the movement this month.

Buyers continue to take advantage of the weak market that continues heavy in spite of the light receipts. Fine coal has sold as low as $1.55, but the market generally rules 5 to 10c. higher. The difference between what jobbers have to pay and the market for spot coal excludes buying for current shipments. Most of the coal coming in is on contract except some coarse coal, which is sent on consignment.

The Lake shippers plan to move a little more coal this month than last. The shipping season will not be normal for two months yet but the movement by that time will be up to last year. The buying for threshing will commence in the Northwest the latter part of this month. Ore shipments are expected to be larger after the middle of the month because freight rates from the ranges back of Duluth-Superior and Two Harbors were reduced 5c. a ton effective June 1. A number of buyers have postponed orders until June 1 for this reason. This will increase the demand for railroad and mining fuel.

Vessels were held over Saturday and Monday to get coal cargoes. Tonnage is exceedingly plentiful and will continue so the next 30 days.

Jobbers are paying the following prices for shipment:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump	$3.10	....	......	....	....
Lump, ¾ in.	.....	$2.20@2.25	$2.00	$1.80@1.85	$1.75@1.85
Egg	3.10	....	......	....	....
Mine run	2.65@2.70	2.10	1.85	1.85@1.90	1.75@1.85
Slack	......	1.65@1.70	1.60	1.65@1.70	....

CINCINNATI

Contracting in both steam and domestic coals continues slow and at low prices.

The tendency noticeable to delay buying as long as possible, and then to buy only in small quantities, is still the outstanding feature of the coal market. Instead of taking advantage of the situation to accumulate stocks on very attractive terms, consumers evidently prefer to fill current needs with the cheap spot coal offered, deferring contracting with an evident hope of still lower prices. The Lake movement is not developing as expected, although it is more brisk than at first.

LOUISVILLE

River shipments beginning to arrive but otherwise the trade is devoid of interest.

Nominally the coals for the domestic trade advanced 10c. on June 1, $1.40 for four-inch lump being the base price. Whether this advance will be maintained in actual transactions is generally doubted. Kentucky operators and dealers are looking to the opening of the Lake trade to relieve at least some of the competition from the sections which reach that market. The stocking operations among the retailers are as yet not proceeding in a satisfactory manner. Steam coals show virtually no change.

The first shipments of coal from Pittsburgh since the first of March are now reaching here, the vanguard of some 13 tows, with a total of 244 coal boats and barges laden with nearly a quarter of a million tons. It was estimated in reports from Pittsburgh that three million tons have accumulated in the local pools awaiting a stage of the river which would permit shipments south. The heavy rains of the last two weeks have given this stage, after three months of what was practically drought.

BIRMINGHAM, ALA.

Steam coal shows slight improvement but domestic grades continue very quiet.

The past week has brought no relief for the lump coal situation, the demand being about as near to nothing as it could be. In fact, there is less business being done on this grade than at any time during the past two years. Steam coal is in better shape, though the tonnage moving is not up to normal though it seems to be improving, both locally and on bunker business. Many of the mines which have been closed down for the past six months are now operating, though only about three days a week, while the average throughout the district is from three to four days a week. Coal is being moved down the Warrior River to Mobile and New Orleans since Lock 17 was officially opened on May 13.

COKE

CONNELLSVILLE

Foundry coke moderately active. Furnace coke very dull but with operators holding slightly firmer views. Production and shipments make new records for this movement.

There continues to be a fair volume of contracting for foundry coke, chiefly for the twelvemonth beginning July 1, though some operators are making an effort to limit contracts to six months, expecting better prices later, for delivery after Jan. 1. The regular contract price for standard high grade foundry coke is $2.40, and the leading operators seem to be adhering to this price. Less favorite brands may be had down to $2.20. There is moderate buying of foundry coke for prompt shipment, particularly by those who contemplate the possibility of changing brands with their new contracts. According to grade prompt foundry is bringing $2 to $2.40.

Furnace coke is dull and inactive as to both prompt and contract. It appears that few contracts are to run out June 30, and as yet few idle furnaces contemplate going into blast. The views of operators, however, are a shade stiffer. We quote furnace coke at $1.50@1.55 for spot shipment in small lots, $1.60 to July 1 and $1.75 for shipment to Jan. 1.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 22 at 306,691 tons, an increase of 9137 tons, and shipments at 305,047 tons, an increase of 9080 tons. These figures exceed the best previous records on this movement by 7198 tons in the case of production and by 1670 tons in the case of shipments.

Buffalo—The coke trade is as dull as ever, waiting as formerly on the movement of iron. It would seem that the demand for coke is even lighter than anything in iron and the amount of iron ore coming down the Lakes is not large, apparently nothing being done that anticipates a large fall trade in iron or even a guess that there will be a revival of demand next winter. The quotations remain on the basis of $4.15 for best 72-hr. Connellsville foundry, with $3.15 for stock coke.

Chicago—Country dealers show an inclination to stock up on domestic sizes, and some improvement is noted in furnace and foundry demand. Market prices are about the same as last week, being as follows: Byproduct, $4.45@4.65; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75@4; furnace, $4.50@4.65.

MIDDLE WESTERN

GENERAL REVIEW

Buying slow and prices do not advance. Screenings continue firm. Pocahontas and smokeless coals strong. Anthracite demand below normal.

Screenings have continued on about the same level as a week ago, prices averaging about 85c. to 90c., although toward the close of the week they showed a slight softening. No perceptible increase in the consumption of fine coal by manufacturing plants has been evidenced. The insignificant demand for coarser sizes results in a reduction in the output of all grades, which in turn contributes to the maintenance of high prices on screenings.

The volume of coal taken by the retail yards is still below normal. The consumer buys only for his immediate needs, and no orders are being placed for storage purposes. The dealers are still finding more or less trouble in making collections some of their unpaid accounts being as far back as last fall, and this has doubtless made them hesitate about placing orders with shippers. As a result of last year's experience country dealers in many cases are showing no disposition to make contracts preferring to take their chances in the open market this fall and winter and shippers are not pressing them to change from this attitude. It is anticipated that storage business will not open to any considerable extent before June 15 and in many cases later.

CHICAGO

Movement light in all directions but an improvement anticipated soon. Prepared grades of West Virginia in fair demand and Hocking coals also improving.

Southern Illinois producers report a slight increased buying from Western sources for domestic sizes for early delivery. Screenings from Franklin and Williamson Counties are scarce and bring high prices. Carterville washed sizes are strong, but raw screenings are weak, having been offered in the Chicago market recently at as low as 75c. per ton. The situation with respect to coarse coals from these districts is expected to improve slowly but surely from now on.

No change has occurred in the Springfield district. The minimum amount of railroad coal is moving, while there is a strong demand for screenings, shippers not being able to fill all the orders received.

Indiana coals are flat except screenings, for which the demand has been strong until the latter part of the week, when some softness was noted. Some contracts for screenings have been closed at the same figures as last season.

West Virginia smokeless in the prepared sizes is strong, but weak on mine-run, which has been quoted as low as $1 per ton in the Chicago market. Retailers are showing more eagerness to close contracts. Splint coals are dull and prices inclined to be weak. Some consignment coal has been moved at whatever prices it would bring. Pennsylvania smokeless grades are becoming stronger, and the retail trade is commencing to place more orders for these coals.

Eastern Kentucky fuels are inactive with prices most variable. It is not thought that an increased demand for these grades will be felt before late in the summer.

The movement of Hocking coal is light but it is held at fairly firm prices. Shipments are commencing to move in larger quantities via the Lakes, which is having a beneficial effect. It is reported a few contracts have been closed.

The end of May saw improved buying of anthracite. Prices are well maintained, and little free coal has moved into this district. Curtailment of anthracite production is evidently having a good effect on the Western situation.

The market is quotable as follows:

	Williamson and Franklin Cos.	Springfield	Sullivan	Clinton	Greene Co.
Lump......	$1.25@1.35	$1.25@1.35	....	....	....

INDIANAPOLIS

Business quiet but with a fair undertone.

The cool weather in May created a market for domestic grades that is unusual so late in the season, though it was not extensive. Most of the mines in operation are making good time though others are closed down entirely. Unless the unexpected happens industrially and commercially, the trade will remain at a steady level. The educational institutions will soon begin ordering their season's supplies, to be delivered in June, July or August, during the vacation period; July and August also bring a demand from the threshers. In August the retailers begin to give their first orders and manufacturing plants to accumulate their winter surpluses. The factory demand continues to show a slight improvement. There is good call for slack, at 85c. for Nos. 5 and 6 and 90c. for No. 4. Prices at the mines continue at the summer level.

ST. LOUIS

Retail trade good but the wholesale business is at a standstill. High river stage releases Pittsburgh coal and closes the Southern markets to St. Louis agencies.

The local market is practically at a stand-still. Some Carterville coal is beginning to move into the country, and screenings seem to be in demand. Standard grades are bringing 85 to 90c., and Carterville is strong at 95c. Carterville lump has been selling at $1.05 to $1.20 during the past week, and Franklin County is still held at $1.25. Standard 2-in. lump is quoted 77½c. at the mines, or rather that is the price made by the recently formed selling agency; the better grades of Standard coal are bringing $1 for 2-in. lump and $1.10 for 6-in. lump.

In a retail way conditions are about normal. What coal is moving in wagon-load lots is bringing a good price. During the past week the ice business dropped off considerably, and with just a small amount of coal being ordered, the retailers have found things rather slow.

There will be a dropping off in the tonnage of Illinois coal moving south to river points, which has been unusually heavy for the past two months or more. Low water in the Ohio River tied up Pittsburgh coal, but the recent rains released 13 tows of 244 barges laden with about 214,000 tons.

KANSAS CITY

The wholesale business has increased during the week and the shipments of coal are coming in faster every day. The retail trade has shown a slight change for the better, owing to the fact that the weather has been decidedly cool. Delays in shipments have occurred owing to the high water all through the river sections of Kansas and Missouri.

PRODUCTION AND TRANSPORTATION STATISTICS

NORFOLK & WESTERN

Destination of shipments over this road for April of this year, the four months of this year and last year were as follows, in short tons:

	April		Four Months	
Coal	1914	1915	1914	1915
Tidewater, foreign	188,513	365,874	617,185	753,317
Tidewater, coastwise	323,280	216,087	1,315,143	1,052,009
Domestic	1,605,493	1,618,590	5,929,365	5,807,936
Coke				
Tidewater, foreign	......	1,122	15	2,959
Domestic	86,918	76,450	404,587	284,537
Total	2,204,204	2,278,123	8,266,295	7,900,758

VIRGINIAN RAILWAY

Shipments over this road for March of the current year amounted to 309,427 short tons as compared with 344,139 during the preceding month.

RATE DECISIONS

I. C. C. No. 6001—Basin Supply Co. vs. Texarkana & Ft. Smith Ry. Co.

1. The carrying of coal for use as fuel and to be consumed by a vessel engaged in coastwise or foreign trade does not constitute a coastwise or export movement of the commodity.

2. Defendant's demurrage regulations relative to the free time allowance on bunker coal at Port Arthur, Tex., not found to be unreasonable or unjustly discriminatory. Complaint dismissed.

Investigation and Suspension Docket No. 475—Bituminous coal rates to Baltimore, Md., and other points.

1. Proposed increases in rates for the transportation of bituminous coal from mines in Pennsylvania, Maryland, and West Virginia to Philadelphia, Penn., Wilmington, Del., and Baltimore, Md., for transshipment to points inside the capes of the Delaware and Chesapeake bays not justified. Tariffs naming the increased rates required to be canceled.

2. If rail carriers be permitted to establish rates in connection with water carriers upon a basis which will equalize shippers at various points along the waterway, they will absorb the benefit which should accrue to the public of the lower cost of water transportation.

I. C. C. No. 6617—Application of the Spokane, Portland & Seattle Ry. Co., under the provision of section 5 of the act to regulate commerce, as amended by section 11 of the Panama Canal Act, in connection with the operation of the Dalles, Portland & Astoria Navigation Co.

On petition of the Spokane, Portland & Seattle Ry. Co. under section 5 of the act, as amended by the Panama Canal act, for a temporary extension of time during which petitioner may retain ownership of the Dalles, Portland & Astoria Navigation Co.; **Held—**

1. That the Dalles, Portland & Astoria Navigation Co. does and may compete with petitioner's rail line.

2. That the continued ownership by petitioner of the Dalles, Portland & Astoria Navigation Co. would not be in the interest of the public and of advantage to the convenience and commerce of the people, and that it would exclude, prevent, or reduce competition on the water route here considered.

3. Petition denied, effective June 1, 1915.

I. C. C. No. 6976—Daly Coal Co. Et al vs. Chicago & Alton R.R. Co., Et al.

Rates on bituminous coal from mines in Illinois and Indiana to St. Paul and Minneapolis, Minn., not found unreasonable. Complaint dismissed.

FOREIGN MARKETS

GREAT BRITAIN

Difficulty in obtaining privilege to export. Considerable business going to American operators.

Attention naturally still centers on the Government prohibition of unlicensed coal exports and the method of issuing licences. There is no doubt that the restriction of exports from this country is greatly stimulating the demand for American coal, particularly for shipment to Italy. So far as the North-East Coast is concerned, the refusal of licences puts a check on any expansion of trade with Scandinavian countries, on which many of the collieries are greatly dependent. Difficulty in securing licences has also been experienced in South Wales markets. We understand that the Norwegian State Railways have now contracted for their supplies of steam coal over the summer months. The original inquiry was for 40,000 tons, but the quantity contracted for is now stated to be 80,000 tons. Tenders for the Swedish State Railways are said to have been prepared on the basis of about $6 a ton f.o.b. for best Northumberland steams, subject to licence.—"The Iron & Coal Trades Review."

May 21—Business is on rather quiet lines and prices are lower. It is anticipated, however, that an improvement will shortly set in. Quotations are approximately as follow:

Best Welsh steam	Nominal	Best Monmouthshires	$7.92@8.04
Best seconds	Nominal	Seconds	7.44@7.68
Seconds	$7.44@7.92	Best Cardiff smalls	5.04@5.16
Best dry coals	8.40@8.88	Cargo smalls	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is quiet and rates have further weakened. They are approximately as follow:

Gibraltar	$4.80	Naples	$5.76	St. Vincent	$4.56
Marseilles	5.79	Alexandria	5.28	Rio de Janeiro	6.60
Algiers	5.79	Port Said	5.28	Monte Video	6.00
Genoa	5.76	Las Palmas	4.32	River Plate	6.24

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Italy—An American consular officer in Italy reports that a firm in his district desires to communicate with American exporters of bunker coal.

Canada—A report received from an American consular officer in Canada states that a business man in his district is undertaking to establish a rather extensive coal business. Prices on a good quality of anthracite coal, quoted f.o.b. shipping point, are desired. The man states that the initial orders will probably amount to 1000 to 1500 tons. (No. 16,959.)

Great Britain—The British coal freighters "Glenmoroen" and "Therese Heymann" have both been posted at Lloyd's as among the victims of the German raiders. The "Glenmoroen" of Leith sailed from Tyne for Leghorn on Dec. 26, and the "Therese Heymann" of London sailed from the same port for Savona, Dec. 25.

Spain—An American consular officer in Spain transmits the names and addresses of a number of leading coal importers and merchants in his district. Correspondence should be conducted in Spanish.

Italy—A firm in Italy informs an American consular officer that it desires to communicate with American manufacturers and exporters of coal. Correspondence may be in English. References are given.

Buenos Aires—The mayor of Buenos Aires has addressed a note to the Minister of the Interior asking to be informed whether the Comodoro Rivadavia Exploitation Committee could supply the municipality with 3500 tons of petroleum fuel annually. The various power installations of the municipality consume 5000 tons of Cardiff coal yearly, which at $12.75 per ton comes to $64,000 per annum. It is anticipated that the substitution of the Comodoro Rivadavia oil would result in an annual economy of $30,000. The modifications in the boiler installations that this change of fuel would necessitate are being studied.

Spain—Madrid newspapers feature offers made by American exporters of coal. The list of firms interested in coal, which was furnished by the consulate to the Ministry of Treasury, is published with the following statement from the ministry: The United Statess offers to sell or send to Spain as many shiploads of coal as may be necessary. The price of this coal c.i.f. Spanish port, according to information at hand, will be between 64 and 65 pesetas (about $13.12 and $13.32) per long ton.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 38.

✚Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page (all in Vol. 7) on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
508	Supt. of Supplies	Philadelphia	Penn.		955
679	Board of Education	Dayton	Ohio	6000	955
691	Watervliet Arsenal	Watervliet	N. Y.		877
728	Board of County Comrs.	Bryan	Ohio	125a	916
733	Bd. of Control and Supply	Providence	R. I.		917
735	Board of Education	Davenport	Iowa	2900b	917
755	Board of Education	Lakewood	Ohio	2000b	917
776	Board of Education	Ridgefield Park	N. J.	300a	956
778	Mich. Home and Training School	Lapeer	Mich.	7000b	956
778	Mich. Home and Training School	Lapeer	Mich.	100a	956
779	Electric Light Plant	Onawa	Iowa		956

a Indicates anthracite coal. b Indicates bituminous.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

✚No. 486—Boston, Mass.—Bids have been received on this contract (Vol. 7, pp. 665, 915), which provides for the Massachusetts hospitals, as follows:

Bidders	Boston State Hospital, 6500 tons	Boston Psychopathic Hospital, 1500 tons	Danvers State Hospital, 6500 tons	Foxboro State Hospital, 2000 tons	Gardner State Colony, 800 tons	Grafton State Hospital, 3000 tons	Medfield State Hospital, 6000 tons	Monson State Hospital, 3400 tons	Northampton State Hospital, 1500 tons	Taunton State Hospital, 2000 tons	Waverley School for Feeble-Minded, 3000 tons	Westboro State Hospital, 5000 tons	Worcester State Hospital, 5500 tons	Wrentham State School, 2000 tons

+ Plus 85 cts. ft. B, Birdseye.
Address E. R. Libby, Room 6, State House, Boston, Mass.

✚No. 541—Toronto, Can.—Bids on this contract (Vol. 7, p. 708), which provides for furnishing coal to various public buildings throughout Canada, will be received until June 17. Specifications and proposal forms can be had on application. Address Secretary, Department of Public Works, Toronto, Can.

✚No. 550—Norfolk, Va.—Only one bid has been received on this contract (Vol. 7, p. 709), which provides for furnishing the local War Department with 3000 tons of bituminous coal. The company bidding was Nottingham & Wrenn Co., and the price quoted was $2.50 per ton. Address Lieut.-Col. of Engrs. Pervey, U. S. Eng. Office, Norfolk, Va.

No. 764—Franklin, Ohio—This contract (Vol. 7, p. 956) should read 1000 tons per month instead of 1000 per year, as previously noted. Address Secy. Fred B. Zartman, Franklin Board & Paper Co., Franklin, Ohio.

✚No. 706—New York, N. Y.—The date of opening the re-advertised bids on this contract, which was originally set for June 10, has been changed to June 11. This contract (Vol. 7, pp. 877, 918, 955) covers the consolidated fuel and forage bids, issued by the Central Purchasing Committee, on which the first original bids have been rejected. The original bids will not appear in these columns, but a complete list may be obtained on application to the editorial department. Address regarding the contract Secy. F. R. Leach, Central Purchasing Committee, Room 1226, Municipal Bldg., New York City.

✚No. 719—Revere, Mass.—The bids on this contract (Vol. 7, p. 916), which provides for furnishing the coal requirements of the city buildings during the ensuing year were as follows: George F. Proctor & Co., stove, egg and nut, $6.55; stove and nut coal for Charity Dept., $7.25. Metropolitan Coal Co., bituminous mine-run (14,400 B.t.u.), $4.40; stove and egg, $6.35; nut, $6.60; nut coal for Charity Dept., $7.50. Chelsea Iron & Coal Co., egg and stove, $6.57; Lehigh egg and stove, $6.72. Revere Ice & Fuel Co., bituminous lump (14,800 B.t.u.), $4.75; stove and egg, $6.75; nut, $7.50. Staples Coal Co., stove and egg, $6.49; nut, $6.74. Address Mayor Arthur B. Curtis, Revere, Mass.

✚No. 726—New York—Bids on this contract (Vol. 7, pp. 916, 955) were opened last Tuesday morning (June 1), and were as follows:

	Item 1	Item 2	Item 3
Wm. Farrell & Son	$6.16	....	....
Burns Bros.	6.18	$5.84	$5.98
Bacon Coal Co.	....	....	5.79
Meyer, Denker-Sinram Co.	...	5.90	5.97
Jos. Gordon, Inc.	...	6.08	....
Commercial Coal Co.	....	5.90	....

Item 1—2700 gross tons egg or stove coal for fireboats berthed on the North River and New York Harbor. Item 2—1450 gross tons egg or stove coal for fireboats on East River. Item 3—1150 gross tons egg or stove coal for fireboats berthed on the Harlem River. Address Fire Commissioner Robert Adamson, Municipal Building, New York City.

✚No. 734—Brookings, S. D.—This contract (Vol. 7, p. 917), which provides for furnishing the fuel requirements of the local Light, Heat and Water Department, will not be let before July. In the meantime competitive tests are being conducted with various coals in order to determine which will give the most economical results. Address Supt. A. W. Morton, Light, Heat & Water Dept., Brookings, S. D.

+No. 777—Washington, D. C.—Bids on this contract (Vol. 7, p. 956), which provides for furnishing the Capitol Bldg. with coal, were as follows:

[1] Average. [2] Contractor for year, ending June 30, 1915.

The Logan Coal Co. bid $2.83 on "B" or Miller vein, South Fork coal. The Maryland C. & C. Co. bid $2.89 on Imperial No. 1 (Guyon), $2.94 on Imperial No. 2, both Clearfield County, Pennsylvania, and $3 on New River. Lynah & Read bid $2.85 on Cardiff mine-run. Address Elliott Woods, U. S. Capitol Bldg., Washington, D. C.

New Business

+No. 782—White Plains, N. Y.—Sealed proposals will be received until 5 p.m., June 14, for furnishing about 1000 gross tons of bituminous coal for the local water-works. A certified check for $100 must accompany each bid. Address Board of Water Commissioners, 64 Martine Ave., White Plains, N. Y.

+No. 783—Indianapolis, Ind.—The Board of Trustees of the Central Indiana Hospital for Insane will receive bids until June 9, for furnishing 24,000 tons of steam coal f.o.b. hospital switch. Bidders must state the grade of coal they propose to furnish, block, lump, steam lump, nut, mine-run, slack or other grades, must give name and location of the mine or mines from which the coal is mined and submit an analysis with their bid. Deliveries are to begin Oct. 1, 1915, and to be completed Sept. 30, 1916 and are to be in such quantities and at such time as required. Coal is to be accepted at hospital weights. Sufficient bond must be given and a certified check for $500 accompanying each bid. Address Secy. L. Ert. Slack, Central Indiana Hospital for Insane, Indianapolis, Ind.

No. 784—Louisville, Ky.—William Schuff & Co., tanners, at this place, will be in the market about July 1 for two car loads of nut and slack coal per month during the ensuing year. Address Supt. F. W. Wagner, William Schuff & Co., 803 South 12th St., Louisville, Ky.

+No. 785—Tupelo, Miss.—The Water and Light Plant at this place will be in the market about June 30 for its annual requirements of coal, involving 'about 4500 tons. Alabama bituminous coal is ordinarily used and the cost is approximately $2.05 per ton. The call for bids is advertised. Address W. H. St. John, Box 565, Tupelo, Miss.

+No. 786—Elgin, Ill.—The Board of Education will contract some time during the latter part of June for approximately 1575 tons of Christopher, Franklin County, Ill., coal. The business is let on competitive bids, which are advertised in the local papers for 10 days. The present contract is being filled at about $3.12 per ton in the bins. Address Supply Committee, Board of Education, Elgin, Ill.

+No. 787—Springfield, Ohio—The Hospital Board at this place will receive bids until noon, June 15, for furnishing the coal required during the period ending May 1, 1916. Bids should cover cost of delivery in bins and must be accompanied by satisfactory bonds for $200. Address Clk. William H. Mahoney, Bd. of Hospitals, Room 2, City Bldg., Springfield, Ohio.

No. 788—Chicago, Ill.—The American Varnish Co. will contract about July 1 for a year's supply of Illinois or Indiana mine-run or nut coal. This company consumes about 70 tons per month. Address Pur. Agt. Seegers, American Varnish Co., Chicago, Ill.

No. 789—Louisville, Ky.—The Louisville Hotel will close contract about July 1 for 3500 tons of nut and slack coal to be delivered throughout the year at the rate of approximately ten tons per day. The contract is let by competition. Address Mgr. Herman Steinhilber, Louisville Hotel, Louisville, Ky.

No. 790—Chicago, Ill.—The Bryant Mfg. Co., will be in the market about July 1 for one year's contract, for 200 tons of 72 hr. Connellsville coke. Address Purchasing Agent, Bryant Mfg. Co., Chicago, Ill.

No. 791—Louisville, Ky.—Various distilleries and breweries in Kentucky are in the market for 600,000 tons of slack, nut and lump coal. The contract will be closed July 1. Specifications as to kind of coal and place and conditions of delivery can be secured now. Address R. E. Wathen, 104 West Main St. Louisville, Ky.

No. 792—Louisville, Ky.—The Joseph Schwab Jr., Distillery, will contract July 1 for a year's supply of nut and slack coal. Seven tons a day is consumed, which is delivered by rail. The present contract is held by the Continental Coal Corp. Address Joseph Schwab Jr., Distillery, 815 Logan St., Louisville, Ky.

+No. 793—Atlanta, Ga.—The Georgia Railway & Power Co., at this place, will be in the market about July 1 for 50,000 tons of Alabama coal which usually costs about $2.50 per ton delivered. Address Purchasing Agent, Georgia Railway & Power Co., Atlanta, Ga.

+No. 794—Jackson, Miss.—Sealed proposals will be received until noon, June 7, for furnishing the state institutions at this place and at Meridian, with coal as follows: East Mississippi Insane Asylum, 1500 tons; State Insane Hospital, 2500 tons for delivery on switch at asylum in suburbs of Jackson; State Capitol Building, D. & D. Institute, Blind Institute, State Charity Hospital, 2000 tons. No. 2 lump coal only is required, and the successful bidder must furnish a bond for $2000. Address Secy. Joseph W. Power, Bd. of Public Contracts, Jackson, Miss.

+No. 795—Cullman, Ala.—The Light and Water Plant at this place will be in the market about July 1 for 2400 tons of washed nut coal, which is usually bought at $2.60 per ton. The business is let on a competitive basis. Address Supt. B. Kiel, City of Cullman Light and Water Plant, Cullman, Ala.

+No. 796—Havelock, N. D.—The Board of Education at this place received bids until noon, June 1, for furnishing four or five double car loads of coal for each of the four schools in District No. 3. Address Clk. Mrs. Geo. B. Bagley, Bd. of Edu., Havelock, N. D.

+No. 797—Higginsville, Mo.—Municipal Electric Light & Water Plant at this place will be in the market the first Monday in July for 1440 tons of bituminous mine-run coal. The current contract is being filled at $2.56¼ at boilers. The business is let on a competitive basis. Address Supt. D. Riepe, Municipal Electric Light & Water Plant, Higginsville, Mo.

No. 798—Iowa Falls, Iowa—Sealed proposals were received until 7:30 p.m., June 4, for furnishing the Local Board of Education with approximately 200 tons of Brazil block lump coal, proposals to cover the cost of delivery at the school houses. Address Secy. T. E. Bell, Bd. of Edu., Iowa Falls, Iowa.

+No. 799—London, Ohio—The Municipal Light plant at this place will be in the market about July 1, for 1800 to 2000 tons of coal. Smithers Creek, W. Va., coal is being used at present, the cost being $2.35 per ton delivered. The coal is bought on competitive bids. Address Supt. H. W. Dickinson, Municipal Light Plant, London, Ohio.

No. 800—Nevada, Mo.—Bids will be received by the Lincoln Institute at this place, until June 9, for furnishing its coal requirements during the fiscal year ending July 1, 1916. Bids should cover cost of delivery in bins at the school. Address Secy. Nelson C. Burch, Lincoln Institute, Nevada, Mo.

+No. 801—Henderson, Ky.—The Municipal Electric Light Station at this place will be in the market July 1 for about 9000 tons of slack coal. The coal is bought on competitive bids, and the current contract is being filled on the basis of about $1 per ton. Address Supt. L. P. Hite, Municipal Electric Light Station, Henderson, Ky.

No. 802—Boston, Mass.—The Bay State Ry. Co. will contract about July 1 for about 150,000 tons of bituminous mine-run coal and 4000 tons of anthracite screenings. Deliveries are to be made at various points, principally by water. Address A. P. Emmons, Bay State Ry. Co., 84 State St., Boston, Mass.

+No. 803—Jackson, Mich.—The Board of Education at this place will be in the market about July 1 for approximately 350 tons of anthracite, 280 tons of Pocahontas, 700 tons of West Virginia splint and 400 tons of steam nut. The anthracite is usually purchased at $7.75; Pocahontas, $5; West Virginia splint, $3. The call for bids is advertised. Address Committee on Fuel, Board of Education, 331 Ten Eyck St., Jackson, Mich.

+No. 804—Newcomerstown, Ohio—Sealed bids will be received until noon, June 1, for furnishing the Board of Education at this place with 4000 bu. of forked screened coal, 5000 bu. of mine-run, and 1000 bu. of slack coal. Two-thirds of the requirements are to be delivered by Sept. 15. Address Clk. H. H. Eagon, Bd. of Edu., Newcomerstown, Ohio.

+No. 805—Caldwell, Kan.—The Light & Water Plant at this place will contract, about July 1, for approximately 3000 tons of mill coal, which is usually bought at $2.85 per ton delivered in the bin. The business is let on competitive bids. Address Supt. H. W. Baker, Caldwell Light & Water Plant, Caldwell, Kan.

+No. 806—Galveston, Tex.—Sealed proposals will be received until 10 a.m. June 10 for furnishing the Depot Quartermaster of the U. S. Army at this place with approximately 1000 short tons of coal per month during the ensuing year. The coal is for use at the Port of Embarkation. Bids should be submitted covering cost of delivery and trimming in transport bunkers at Galveston and Texas City, Tex.; delivering in transport bunkers but not trimmed; delivered and trimmed in transport bunkers at contractor's dock; the same not trimmed and delivered in contractor's barges alongside of transport; delivered on government barges at contractor's dock; delivered from chutes into transport but not trimmed; delivered in contractor's barges at contractor's dock. All bidders must submit certified check for 15% of the amount involved in the proposal or furnish other satisfactory evidence for the faithful completion of the work. Address Lt. Col. C. R. Krauthoff, Quartermaster Corps, U. S. Army, Galveston, Tex.

No. 807—East Lansing, Mich.—The Michigan Agricultural College will receive bids until noon, June 16, for supplying the Institute with approximately 8000 tons of bituminous nut, pea and slack coal, and 100 tons of bituminous ¾-in. lump. Bids should be made f.o.b. the College siding, via Pere Marquette R.R. Deliveries will be required at the rate of about six cars per week. Bidders must state whether the coal they propose furnishing is mined in Michigan and also give the minimum B.t.u. value guaranteed. Address Secy. A. M. Brown, Michigan Agricultural College, East Lansing, Mich.

+No. 808—Philadelphia, Penn.—Sealed proposals will be received until June 8, for supplying the Bureau of Charities with anthracite stove and pea coal during July, August and September, and the Bureau of Correction with gas coal. All bids must be accompanied by the customary certificate required by the city, guaranteeing the faithful performance of the contract and bids must also be submitted on printed forms which may be had on application. Address Dir. Herman Loeb, Room 312, City Hall, Philadelphia, Penn.

+No. 809—Colfax, Wash.—The Whitman County Government will receive bids until 11 a.m. June 7 for 100 tons of lump coal to be delivered at the Court House in Colfax and 20 tons for delivery at the County Farm nearby. Address County Auditor A. R. Metz, Colfax, Wash.

+No. 810—Oelwein, Iowa—The City Government will receive bids until 8 p.m. June 7 for furnishing approximately 900 tons of coal. Quotations should be f.o.b. Oelwein. Address City Clk. E. H. Burlingham, Oelwein, Iowa.

+No. 811—Chicago, Ill.—The City Government will contract about July 1 for approximately 123,000 tons of lump coal, which is usually bought at about $2.81 per ton. Address Business Manager, Tribune Bldg., Chicago, Ill.

+No. 812—East Providence, R. I.—The Board of Education at this place will receive proposals until June 4, for furnishing about 900 tons of stove, egg and pea coal, delivery to be made during the fiscal year ending June 1, 1916. Address Clk. G. H. Blackwell, Grove Ave., East Providence, R. I.

No. 813—Boston, Mass.—The Stone & Webster Co. at this place will be in the market in July or August for approximately 15,000 tons of New River or Pocahontas mine-run coal for shipment at one of the lower Lake ports. Address R. E. Hamilton, Stone & Webster Co., 147 Milk St., Boston, Mass.

+No. 814—Lawrenceburg, Ind.—Bids will be received by the Board of Education until 7:30 p.m., June 7, for 10,000 bu. of coal for the lighting plant. Address City Clk. Frank Globe, Lighting Plant, Lawrenceburg, Ind.

+No. 815—Toronto, Canada—The Separate School Board at this place received tenders until May 31 for furnishing 200 tons of Pocahontas lump or mine-run coal; 300 tons of anthracite stove and egg coal each, and 200 tons of anthracite grate. Address the Toronto Separate School Board, Toronto, Canada.

Contracts Awarded

Note—Successful bidders are noted in **bold face** type.

+No. 489—Staples, Minn.—This contract (Vol. 7, pp. 665, 748), which provides for furnishing the Municipal Electric Light Plant at this place with coal, has been awarded to the **Dover Lumber Co.,** who was the only bidder. The business was closed at $2.40 per ton f.o.b. Duluth. Address Supt. John Effinger, Municipal Electric Light Plant, Staples, Minn.

+No. 558—Hamilton, Ohio—This contract (Vol. 7, pp. 709, 794, 834), which provides for furnishing the fuel requirements of the local Board of Education, has been awarded to the **Pyrd-Brunner Coal Co.** for furnishing the 1600 tons of smokeless nut and slack. This company was the lowest bidder at $2.38. The business is being handled on a heat unit basis. Address Clk. Charles F. Holdefer, Bd. of Edu., Hamilton City School District, Hamilton, Ohio.

+No. 574—Cincinnati, Ohio—The awards of this contract (Vol. 7, p. 749), which provides for furnishing the local Board of Education with fuel requirements, were as follows: **Marion M. Allen Supply Co.,** smokeless mine-run, District No. 1, $2.81; District No. 2, $2.90. **The Reliance Coal & Coke Co.,** bituminous nut and slack, District No. 1, 2.17; same, bituminous lump, $2.64. **B. H. Wess Grain & Coal Co.,** smokeless mine-run, District No. 3, $2.92; same, bituminous lump, $2.50. **Hyde Park Supply Co.,** District No. 4, smokeless mine-run, $2.94, same, bituminous lump, $3. Address Business Mgr. C. W. Handman, Bd. of Edu., Cincinnati, Ohio.

+No. 593—Boston, Mass.—This contract (Vol. 7, p. 750) was awarded to **Batchelder Bros.,** at $4.23 for bituminous, $5.68 furnace, $6.13 egg and stove and $2.50 screenings, or a gross of $154,589.85. The Staples Coal Co. bid a total of $160,174.90; City Fuel Co., $160,841.75. Address Supt. D. Frank Doherty, 808 City Hall Annex, Boston, Mass.

+No. 664—Washington, D. C.—Partial awards have been made on this contract (Vol. 7, pp. 836, 953, 954, 955), which provides for the fuel requirements of the U. S. Navy, as follows: **J. H. Weaver & Co.,** Class 2a, $3.20, 2b, $3.60. **Quemahoning Coal Co.,** Class 3a, $2.65, 3b, $2.75, 3c, $3.05, 5a, $2.58, 5d, $2.87, 5e, $3.38. 6a, $2.57, 6b, $2.70, 6c, $3.17, 6d, $3.07. **Crozer-Pocahontas Co.,** Class 8, $2.60. Classes 1, 4, 7, 9 and 10 have not yet been awarded. Address Paymaster General of the Navy Samuel McGowan, Washington, D. C.

+No. 696—Salem, Mass.—This contract (Vol. 7, pp. 877, 955) has been awarded as follows: **John Girdler,** Georges Creek Cumberland coal for delivery at Salem, 450 tons at $4.55 and 300 tons at $4.65. **G. L. Gage,** 250 tons of New River coal for delivery at Lawrence, $4.95. **Cross Coal Co.,** 200 tons of New River coal for delivery at Lawrence, $4.95. **Atkinson Coal Co.,** 200 tons of New River coal for delivery at Ipswich, $4.70, and 150 tons for delivery at Newburyport, $4.47. **Theberge Bros.,** 450 tons of New River coal for delivery at Lawrence, $5.14. **Charlotte Fairfield,** 25 tons of anthracite for delivery at Salem, $6.85. **M. O'Mahoney,** 25 tons of anthracite for delivery at Lawrence, $8.45, and 30 tons for delivery at Lawrence, $7.45. Address Clk. H. E. Thurston, Essex County, Salem, Mass.

Contract Notes

Baltimore Exports—Baltimore has made a new record for coal exporting. During May a total of more than 230,000 tons was sent out by foreign ports.

Birmingham, Ala.—Contracts aggregating over 750,000 tons of coal are expected to be closed in this district shortly, most of this tonnage going on large contracts to railroads. Most of the Southern roads contract during the summer months.

Indianapolis, Ind.—Coal contracts for the fiscal year beginning June 1 have been awarded by the board of park commissioners. The Indianapolis Mortar & Fuel Co. will supply shoveled lump Pocahontas, 65% lump, at $3.95 a ton. The Frederick Coal Co. will supply mine-run Pocahontas at $3.40 a ton.

Birmingham, Ala.—The Seaboard Airline R.R. has placed an order for 140,000 tons of steam coal with the Alabama Co. This is the first of the big railroad contracts to be closed this season. This coal is for the entire Southern Division of the Seaboard and is for delivery in equal monthly installments over the next twelve months.

+Washington, D. C.—Bids received in response to the request for telegraphic proposals for the delivery of 5000 tons of coal at the Naval Station, Key West, Fla. were as follows: Pocahontas Fuel Co., $4.54; Penn Fuel Co. $4.88; Smokeless Fuel Co., $4.54; J. H. Weaver & Co., $4.65; Willard Bros., $4.60; West Virginia Coal Co., $5.23; Castner, Curran & Bullitt, Inc., $4.45; Chesapeake & Ohio Coal & Coke Co., $4.78; William C. Atwater & Co., $4.80. It has been decided to reject all bids and use coal from their regular supply. Address Paymaster Gen. of the Navy Samuel McGowan, Navy Dept., Washington, D. C.

Buffalo, N. Y.—The award of contract for furnishing coal to the institutions of Erie County, N. Y. (Vol. 7, p. 957), is further postponed by the Board of Supervisors at Buffalo to afford time for looking into the legality of one of the low bids.

Northfield, Minn.—The Manhart Coal Co. was awarded the contract for furnishing 400 tons Pocahontas smokeless mine-run coal by the local School Board.

Lockport, N. Y.—The bids on this contract, which provides for furnishing 438 tons of anthracite egg, stove and chestnut coal, were as follows: Entire supply—Lockport Ice & Cold Storage Co., $2369; R. M. Hovey (egg and stove $6, nut $6.25), $2539.25; Graham Coal Co., $2480.40; M. J. Crowe (egg and stove at $5.85), $2503.95; George T. Lennon, $2562.95. Portions of contract—Mahar & Son, egg and stove, $5.51; Lockport Ice & Cold Storage Co., nut $5.78, pea $4.29, egg and stove $5.50; Hinch & Son, stove and egg, $5.55.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

IT was a wise man who said, "If your business isn't worth advertising, advertise it for sale."

Only reliable products can be advertised profitably.

"ADVERTISING is not material substance. It is service," says John Lee Mahin.

"Space, type, words and pictures are only tools the master-workman uses to express an idea. The finished result of the expert work of the advertiser is not a material substance which can be seen with the eyes or touched with the hands, but a definite, positive impression on many human minds which is shown by the voluntary purchase of goods the advertiser wants to sell."

The ads in Coal Age are an exhibit of the best in mining machinery and equipment.

WE are all buyers and sellers. And the first thing necessary between buyer and seller is information.

You don't buy a pump without knowing something about it, and no one buys your services without knowing something about you.

We are a nation of *good* buyers and sellers — we lead the world commercially.

And coincident with that we lead the world in advertising.

We were first to realize that there is no good in unknown good; first to understand that if we could make a little better plough, an improved scale, a more advanced harvesting machine, the world wanted to know about it and was ready with a hand back of each ear to listen.

Then we were the first to see that the cheapest and most effective way to advertise was through printers' ink.

We Americans have learned better than anyone else in the world how to sell goods by learning better how to tell the buyer more about them, in a more interesting, more concise, more time-saving way.

Keep yourself acquainted with the advertising in your field and you'll always be able to buy wisely, safely and with the greatest economy.

That's the American way.

Selecting A Mining Machine

A Manager of a Large Coal Mining Company put the Following Question to Us:

QUESTION:

"I have decided to equip one of our mines with mining machines throughout; we have never had any experience with such machines, and I want to know how to decide upon the make or type of coal cutter that I ought to adopt. I am a great believer in standardizing equipment and I want to make sure that I get the right machine so that I won't have to keep shifting around, and incidentally I desire to avoid filling our supply house with repair parts that will never be used."

FORTUNATELY for our reputation, the manager did not expect an answer; at any rate he didn't allow us time to give one, but continued about as follows:

"First I decided to give the various machine manufacturers opportunity to make test runs, but after investigating, I learned that such tests generally proved that one of the machine runners making the test was head and shoulders above the others, so that as to the actual merits of the machines little could be learned.

"Then I decided to make inquiry as to the cost of upkeep on the different makes, but here again I got nowhere. None of the users of the machines were willing to furnish me with copies of their cost sheets. They volunteered certain figures, but I had no common basis for comparison. I was forcibly reminded of the fact that I have never been very cordial myself toward my neighbors when they sent in requests for information which I considered private property, and this had reference to cost sheets particularly.

"Then it occurred to me that it wasn't necessary to get such cost figures; the companies whose figures I so earnestly desired must surely profit by their own experiences and all that would be necessary would be to watch the purchases of these large companies with years of experience to guide them. But here again I found that I was on the wrong track.

"Three companies, having identical conditions, favored three different machines; a little questioning indicated that in one case salesmanship was the deciding factor, in another a prejudiced master mechanic and in the third the manufacturer of one of the machines was a large customer of the mining company.

"And so it goes; every one has a different idea and a different standard for comparison."

We were on the verge of suggesting that every one has a peculiar way of gathering information and weighing and considering it after it has been gathered.

But our friend came at us suddenly with this: "If there were only one make of mining machine on the market that could be called a success, do you suppose I could afford to adopt it and thereby place myself entirely at the mercy of a single manufacturer?"

We didn't know, and we still don't know. We wonder if the makers know and if they do know would they tell?

Mining Coal with Friable Roof and Soft Floor*

By Fred C. Keighley†

SYNOPSIS—This paper is reproduced because we believe it the last monograph written by the author, who died Apr. 14 of this year. Mr. Keighley had a large experience in mining coal which had not only undesirable roof and floor, but was in addition quite friable itself.

The coking coal known variously as the No. 8, Pittsburgh or Connellsville seam has in places an extremely bad roof. This difficulty is strongly marked in the Connellsville basin, but can be found in other troughs.

In those parts of the area where operations have been conducted for many years it has been noticed that the bad roof usually appears wherever a valley traverses the surface of the coal field. It seems that this is true regardless of the depth of the coal. The bad roof appears whether the coal lies at a depth of 100 or of 600 ft. below the surface.

Why Roof under Hills Is Sometimes Weak

As a rule when the coal seam lies under the plateaus or hills, the roof over the coal is good, and this is true till the coal seam is at a depth of 300 to 400 ft. Thereafter the friability of the roof seems to increase with depth, and thus in many of the mines the roof is somewhat generally brittle. This characteristic seems to be independent of surface topography, and possibly there are three ways in which to explain it:

1. At greater depths there is an increased strain on the strata when mining operations are under way, and possibly the material so burdened fractures and becomes more or less disintegrated. At shallow depths this would not occur.
2. In some cases the first covering of the coal may have been swept away by subsequent erosion and the coal covered later by a deposit of weaker material than that of which the first covering was comprised.
3. In other cases, the friability may arise from conditions which existed when the measures were even deeper than they are now. In other words, the roof was weakened before erosion had carved out the valleys and rounded the hills.

But whatever the cause, the Connellsville seam must be worked exhaustively if there are to be any profits from mining it. The thickness of the coal and its softness might lead one to anticipate that it could be mined cheaply, but the friable roof creates a difficulty which its other qualities cannot overbalance. Much of the coal of the Connellsville region is mined by pick only, and the scale of wages is lower than in other regions where the coal is harder and more difficult to mine. Yet owing to the conditions noted the mining cost is not low.

Many plans have been adopted for mining the coal with the minimum expense where the roof conditions are unfavorable, but no plan seems to be a great improvement over the ordinary methods when everything is considered.

I have had charge of Connellsville coking-coal mines for about 33 years, and all these workings had some areas with bad roof. I have projected workings at depths ranging from 200 to 700 ft., using a dozen or more different schemes, and have never found any marked difficulty in protecting the main headings and air-courses of any mine. But I have experienced some trouble occasionally in protecting the branch, or butt, headings, and I have always had more or less trouble with the rib coal in the rooms.

The Difficulties Are Largely in Rooms

It is true that in many cases the roof will fall in headings and air-courses in spite of all that can be done, but such falls are gradual and are removed as part of the regular mine operations. On the other hand, when falls occur in the rooms they often come suddenly and cover a large area and the break extends so far above the coal that they often reduce and may entirely cut off the production from a certain section of the mine, not only for a day, but perhaps for weeks at a time.

It is clear, then, that any improved method of mining must provide for the protection of the rooms rather than for the care of the headings. Before considering methods that may be improvements on present systems, I would say that I have tried and have seen tried plans such as are outlined in the following paragraphs.

Panels have been projected 1000 ft. wide and 2000 to 4000 ft. long. These constituted what miners term a "pair of flats" because the hauling road and its parallels which traverse the panel by its longer distance are driven on a low grade or on a level. This also results in the Connellsville region in their being driven on the face of the coal.

Such a panel is subdivided into a number of smaller panels that are themselves served by two parallel entries driven at right angles or at some other angle to the flat or face heading depending on the pitch of the coal. These are known as butt headings. These sub-panels are generally 1000 ft. long and 300 to 600 ft. wide. They are divided into a number of working-places known as rooms, and the driving of these leaves strips of coal known as ribs. The number of rooms turned off the butt headings of one of these subdivisions determines in a large degree the size of the pillars, or ribs, left between the rooms.

The rooms being projected from headings driven on the butt of the coal are themselves worked on the face of the seam. They are laid out 40, 50, 60, 80 or 100 ft. apart. As the rooms are generally made 10 ft. wide, the ribs are 30, 40, 50, 70 and 90 ft. thick. The mining code of Pennsylvania requires that airways be driven across from room to room at distances which must not exceed 105 ft. Thus the mine is cut into blocks which cannot measure more than 105 ft. in their smaller dimension.

Various widths have been chosen for rooms with 8 to 30 ft. as limits, but the general belief is that rooms and headings should be driven 10 ft. wide in the Connellsville region. There seems to be no opportunity to improve on this width. The best work has been obtained with large room ribs—50, 70 and 90 ft. thick; but the success has not been as great as might be expected, though, with room ribs of the two larger dimensions, and with any ordinary care in mining a general creep or squeeze cannot occur.

---

*Paper read before the West Virginia Coal Mining Institute at its winter session, Dec. 10, 1914.

†Late general superintendent of mines, Oliver & Snyder Steel Co., Uniontown, Penn.

This is not true when room ribs are made of smaller dimensions, such as 30, 40 or even 50 ft. In the initial stage of rib drawing with such light ribs great success is secured, but when trouble occurs it is usually in the form of a general squeeze or creep that almost paralyzes the output. It has often seemed for a time that the small ribs in the rooms resulted in cheaper mining; but when a squeeze or creep took place the small rib did not permit of the driving of a new road with safety and profit, and consequently the coal remaining in the rib could not be taken out.

With 70-, 80- or 90-ft. ribs there is always sufficient coal left to permit driving a new road with safety through the pillar no matter how badly the roof may have fallen or the coal be shattered on the edges of the pillars. Sometimes a skip off the rib is taken in place of a split, but in any case splitting or skipping of the large ribs entails the use of much timber.

Wide Pillars Certainly Pay Where Coal Is Thick

It is often said that if the extra time and expense of laying out workings with large rib dimensions and the heavy cost of timber were all taken into consideration it is doubtful whether the wide rib would after all be any more profitable than the narrow rib except that a great yield would be obtained per acre. When, however, coal such as the Connellsville seam brings from $2500 to $3500 per acre, it certainly does not pay to lose any of it.

Nearly all experienced miners concede that with narrow ribs only 50 per cent. of the coal is recovered. The best result claimed is 65 per cent., while 90 and 95 per cent. has often been recovered with the larger-rib system. The problem is whether the heavy cost of timber and the still greater cost of labor will counterbalance the loss of from 35 to 50 per cent. of coal. I am disposed to believe that the larger rib, making a larger yield possible, will assure a handsome margin.

Cost of Timbering Is the Main Problem

But I have been puzzled for some time, not so much on the way in which ribs may be made larger, but on the saving of timbering. It must be remembered that the timber and timber work do not represent the whole of the cost of mining rib coal under the conditions which I have stated. It often happens that the removing of falls involves as much expense as first timbering, for not only does the timber have to be reset, but more timber is required.

In other words, an advancing room or the space in front of a rib which is being drawn may cave in and remain quiescent for perhaps a whole year, yet when the débris is removed new falls may occur and the timber may have to be renewed throughout. I have known this to be done several times, and the bottom has had to be ripped every time before a satisfactory tonnage per acre could be obtained.

Reviewing the general conditions to which I have referred and passing judgment on them, I think the following statement can safely be made: Whether the rooms be narrow or wide and the pillars thin or thick under the friable roof of certain portions of the Connellsville coke region the fall of the roof will be equally widespread, and when the room ribs are small sooner or later a general squeeze or creep will take place. With larger ribs the roof will fall and the bottom will heave, but there will be no general squeeze. So it would appear that if the roof must come down, perhaps it would be best for us to take its fall for granted and to make up our minds to let these falls take place when conditions are suited. We should assist the roof, if possible, to come down.

Roof Weakened Far Back of Rib Line

I and others have noticed that after a series of falls have taken place in rib workings the roof conditions appear for a limited time to be much better over the coal remaining unworked in the ribs. Some relief seems to have been given to the overlying measures by the falls, and I depend on this very fact for the operation of my proposed method of working coal having a friable roof and a soft floor.

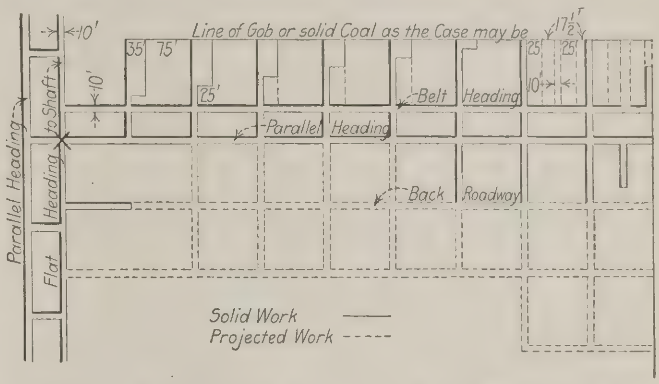

FIG. 1. KEIGHLEY'S PLAN TO AVOID EXPENSE IN TIMBERING

Moreover, falls in rib workings appear to occur in layers. In deep mines after the ribs have been drawn back 100 to 200 ft. from the point where the rib drawing started and a general fall or movement of the roof occurs, the rupture or disturbance does not run up more than from 5 to 30 ft. above the coal. Very often such falls not only take place in the large open spaces where the coal has been withdrawn entirely, but extend into the roof of both rooms and crosscuts for 100 or more feet back from the rib line. Sometimes this resulting weakness may cause falls for several hundred feet.

In coal having 500 or more feet of cover after these falls are cleaned up and rib drawing proceeds as far as 400 or 500 ft., there will be another general fall which seems to reach up 100 ft. or more above the coal and often to the surface. When this occurs it not only breaks the timber at the working-places, but often crushes it several hundred feet away. The timber will often begin to crush several weeks before the fall occurs.

If the cover is 400 to 600 ft. thick and the coal has been thoroughly mined when the rib drawing reaches a point say 1000 ft. from the starting point, the rib work is not nearly so troublesome or expensive, but still there is room for improvement.

These are the conditions which must be considered, and I have schemed the following method of removing the difficulties described. It is illustrated in Fig. 1. Drive an entry or passageway 10 ft. wide at right angles to the flat or face headings. This will run on the butts of the coal and parallel to the edge of the area to be worked by this entry, being distant in the clear 105 ft. at all points. This entry would of course be driven at a different angle if the pitch of the coal would not permit of driving directly on the butt.

A second parallel passageway similar to the one described should be driven 50 ft. from it in the clear. With the conditions as in the illustration, this heading should be placed on the right-hand side of the entry as driven. It will be termed in this description the "parallel heading." Crosscuts should be cut between the two at distances of 105 ft. in the clear.

These roadways may be termed a pair of butt headings, and they may be driven 1050 ft. in addition to the distance allowed for the pillar flanking the face entries, a pair of which will ultimately be driven beyond the butt headings now discussed. In addition they must be long enough to provide a flanking pillar for the face entries from which they are driven. This of course applies only to coal of light pitch. When the pitches are steeper the distance must be shortened.

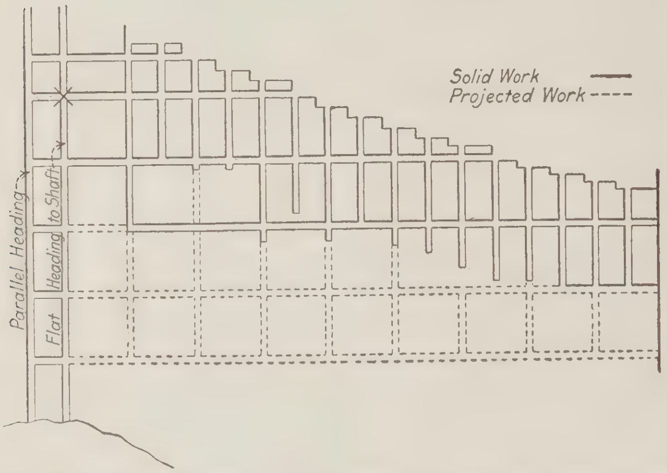

FIG. 2. THE SAME PLAN AFTER IT HAS REACHED ITS FULL DEVELOPMENT

HOW THE ROOMS ARE DRIVEN AND PILLARS DRAWN

Rooms are turned to the left of the first butt heading, these being spaced at $52\frac{1}{2}$-ft. centers. Thus there will be 20 rooms in the butt heading. The first room turned is to be driven up its distance of 105 ft., then 25 ft. of the rib of that room is to be worked back to within 30 ft. of the butt headings, thus leaving a road rib of $17\frac{1}{2}$ ft. for the room above when it is worked. The next room is not to be turned until the second stage of working is reached. In other words, every other room will be worked forward and drawn back as just stated.

The alternate rooms will not be driven until the upper end of the 1050-ft. section is reached. Then these will be turned off successively from the top down, keeping pace with the drawing of the butt-heading stumps as they are withdrawn down toward the foot of the panel.

The rooms on the parallel butt heading will remain undriven until the latter is in a distance of 600 ft. At this point, which will be termed the "600-ft. point," a roadway should be turned off. This will be termed the "600-ft. roadway." It will be driven 105 ft. and at the end of that distance will be turned to the left so as to form an entry on the butts of the coal parallel to the other butt heading and 105 ft. away in the clear. This will be driven to the end of the panel and will be called in this description the "back roadway."

From the 600-ft. point to the limit of the panel on the parallel heading, rooms will be turned to the right at $52\frac{1}{2}$-ft. centers. These will intersect the back roadway. Each room will be 105 ft. long. As soon as the last room is driven through, the coal from the rib work will be hauled down the back roadway through the 600-ft. roadway and thence down either the parallel or the butt heading as may appear best. When the retreating rib work has reached the 600-ft. roadway, another back roadway will be driven upward from the first room of the parallel heading.

BREAKING LINE IS DULY STEPPED

Sketch No. 2 shows the workings when further developed and after rib drawing has been started at the top of the 1050-ft. panel. It will be noted that the work proceeds in steps, as is the general practice in well-ordered rib drawings. It will be seen that, by this arrangement of headings and roadways, crosscuts (except those between the butt heading and its parallel) are entirely eliminated, the back roadways taking their place and being driven as required by the advance of the rib work. Of course, the crosscuts cannot be eliminated between the butt heading and its parallel.

LOWER ROOF IS PERMITTED TO FALL

The object of driving the alternate rooms to the left of the butt heading and drawing out a 25-ft. skip from the pillars is to allow the lower roof to fall. In a panel of 20 rooms 10 would be driven up and drawn, and I believe that the fall of the roof provided by this method of mining would relieve the tension under which a friable roof with soft bottom is usually found when rooms are first driven.

The purpose of laying out blocks 105 ft. square is to avoid conflicts with the mining law of Pennsylvania, as that is the distance beyond which places cannot be driven without providing crosscuts. Perhaps some will wonder that a mining man should wish to avoid the driving of crosscuts, and I admit the care taken to avoid making them has a somewhat "shady look"; but my experience, with that of others, is that crosscuts are a prolific source of roof and floor trouble and one of the principal causes of crush or creep. Many accidents occur because coal and slate fall from both roof and sides where the material which falls has been weakened by the presence of these crosscuts.

TROUBLES WHEN CROSSCUTS ARE REACHED

In rib-work we invariably have much trouble when approaching an old crosscut. The lower roof has nearly always fallen and much slate has to be handled. By my method there would be no crosscuts driven except those from the butt heading to its parallel, and they can be protected by timber work. The rib drawing by this method is all in one direction and *en echelon,* and I think the plan will lower the cost of producing coal whenever covered by a friable roof and supported by a soft bottom. It will also be of value where the roof is friable and the floor is hard.

The work can be developed much faster by my method than by any other because once the upper limit of the panel has been reached there are many points of attack. Moreover, it is not necessary to develop continually by butt headings as the result may be obtained through the driving of 105-ft. places and the extension of back roadways to intersect.

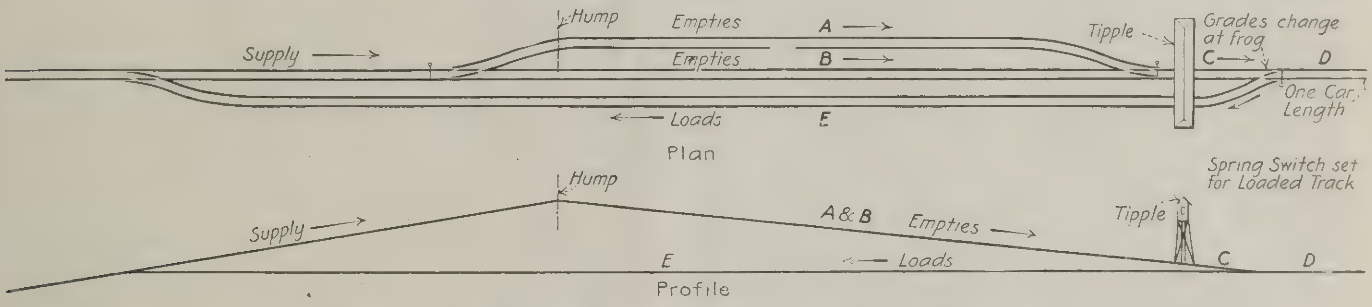
Of course care must be taken not to overdevelop the mine, as under those circumstances the places will stand too long. The system which I propose is elastic, and with good judgment much heading work and consequent driving of crosscuts can be avoided. The so-called back roadways are in a sense crosscuts, but in reality they are haulage roads and airways. They stand open only a short time as compared with the butt headings and parallels in the mines of the Connellsville region. These stand sometimes for as much as 10 years.

Nor is there any need to leave rooms to stand, as under present methods, for years before the ribs are withdrawn. It is no uncommon condition for rooms to be left standing almost as long as the headings. Such delays in room-rib drawing invariably result in the breaking of the posts, timbers and lower roof and entail enormous expense for cleaning up and retimbering the workings.

A Plan for Tipple Tracks

By V. S. Veazey*

It is often impossible to obtain room for a tail track above the tipple location, because the latter sometimes is necessarily situated near the head of a stream or other physical obstacle. The accompanying illustration shows an arrangement which can be adapted to any case where such a condition exists.



Track Arrangement Where a Tail Track Is Impractical

The general plan of operation in the scheme shown in the sketch is to place the empty railroad cars on tracks *A* and *B*. These cars are dropped one at a time downgrade to the tipple, where they are loaded and afterward run by gravity down the grade *C* about 100 ft. In going down track *C*, the cars attain a sufficient momentum or speed to carry them up the grade *D* through a spring switch. Here they come to a stop and run back by gravity down the loaded track *E*.

The railroad locomotive pushes the empties up the supply track and over the knuckle onto tracks *A* and *B*. The locomotive then returns and goes onto track *E*, where it picks up the loaded cars.

* * *

The passage of the compensation bill through the Pennsylvania Senate on May 19 was highly gratifying to all the miners and most of the operators. W. W. Inglis, of the Pennsylvania Coal Co., expressed his approval of its passage.

*Chief engineer, McKell Coal & Coke Co., Glen Jean, W. Va.

How the Chinese Mine Coal

William Barclay Parsons in an address before the Franklin Institute states:

China's mineral wealth is both varied and abundant, and, fortunately, coal is found in great quantities through almost the whole country; in fact, there is scarcely one of the 18 provinces that does not contain coal in paying quantities. Through lack of extensive railways and of power-consuming industries and on account of the great poverty of the people, the consumption of coal per capita is very small. There are a few factories, of course, at Shanghai and other treaty ports, but coal is not in demand otherwise for manufacturing purposes. Nevertheless, about 15,000,000 tons are produced annually from Chinese mines.

The Chinese native mine is a singular affair. The native attacks the bed at the outcrop and usually, for some unknown reason, at a point where the measures are dipping into the hill. He drives a small tunnel not over 5 ft. high and not more than 4 ft. wide, so as to avoid timbering. This he extends downward till his native pump can no longer handle the inflow of water. At that point the mine is considered worked out and is abandoned.

From the initial drift there are no side galleries and no rooms. On the floor of the drift are laid two longitudinal timbers like rails. The coal is loaded into wicker baskets and then hauled up the narrow passage on these rails by manual power. In the native mines of Hunan which Mr. Parsons visited light was secured by burning joss-sticks of punk, giving of course nothing but a faint glow.

Much of the Chinese coal will coke. Some of the anthracite is sufficiently hard and firm to stand the burden of a blast furnace, though nearly all is much softer than its American namesake, but similar in chemical composition. Much of the bituminous coal has a large percentage of ash, and very much of it is so friable as to produce only a small proportion of lump.

When the coal deposits are worked on a large scale it will undoubtedly be found advantageous throughout China to crush most of the coal, wash it and convert it into coke or compress it into briquettes. The natives are already briquetting coal, taking the coal dust, mixing it with clay and selling the coal balls in Chinese cities for local consumption.

By washing the coal from the Ping Hsiang mines, from which is made the coke for the Hankow iron works, the ash content is reduced from 28 to 8 per cent. and the sulphur from 0.65 to 0.1 per cent.

New Tipple at Havaco, W. Va.

By H. Reisser*

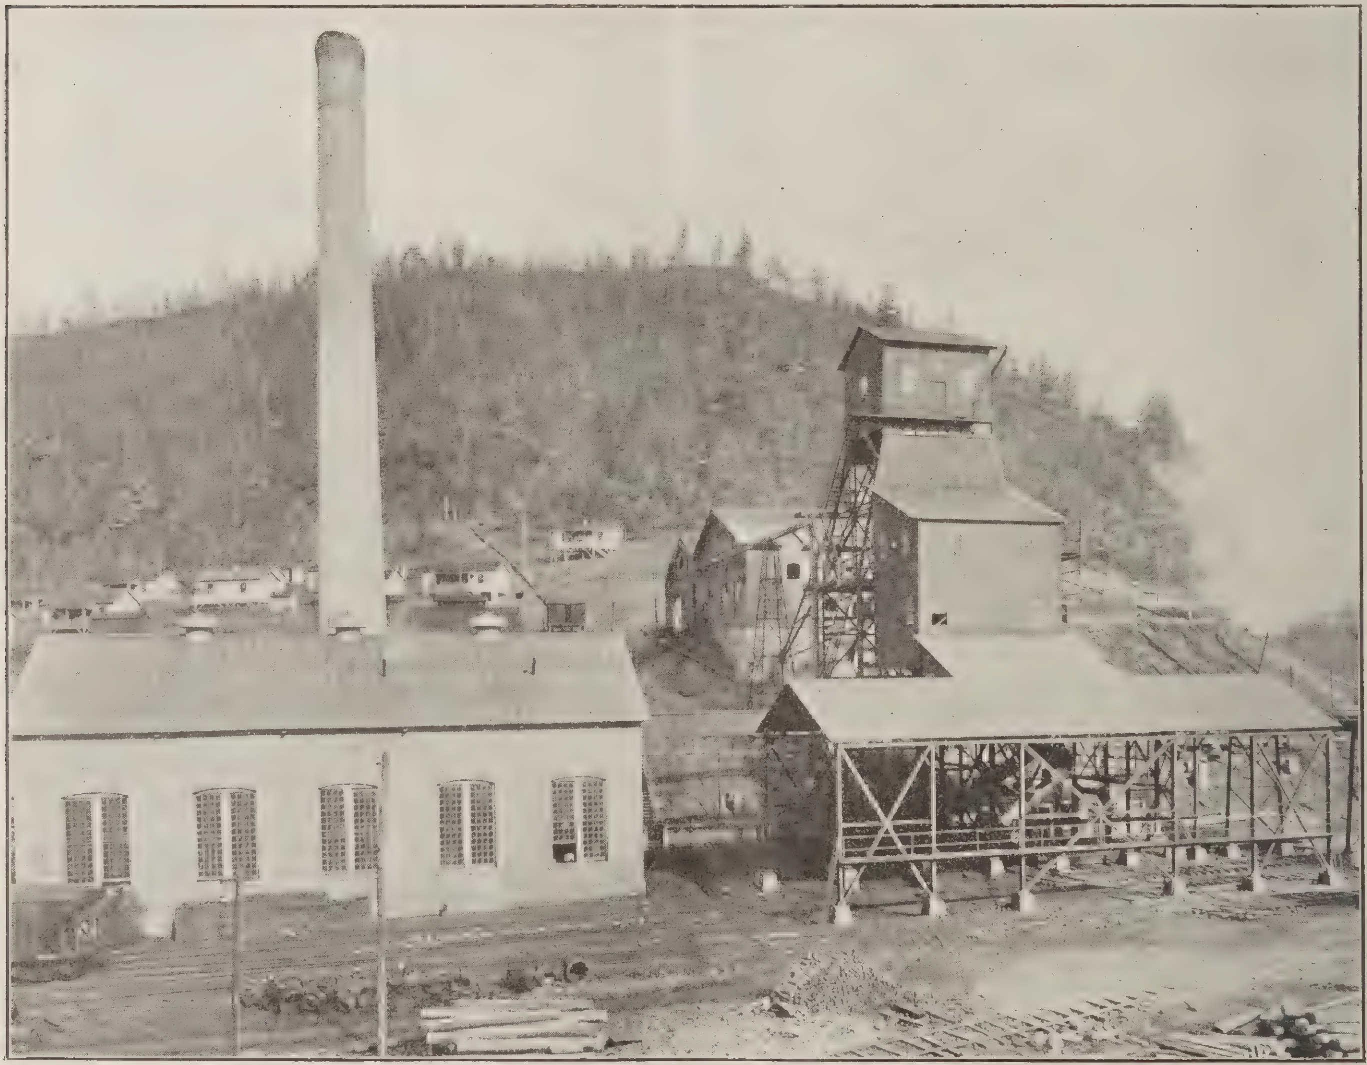
SYNOPSIS—An uptodate tipple and power plant. designed and constructed to secure a high quality product with an equipment as nearly fireproof as possible.

A recent article in Coal Age explained in detail how thoroughly and efficiently the concrete work for both the fan and the cage shafts of the New River & Pocahontas Consolidated Coal Co.'s operation at Havaco, W. Va., were constructed. This article outlines the work done in connection with the plant aboveground, describing in detail the tipple which loads the coal into railroad cars, the power house, the boiler house and the hoist house.

The mine is situated at Havaco, about two miles from Welch, on the Tug River branch of the Norfolk & Western R.R., and is in the heart of the Pocahontas region. The coal needs no further mention, except that it is known to the trade generally as being the best steaming coal so far discovered.

The shaft was driven at a point such that all coal is taken away on the rise, and extends downward some 285 ft. from the surface to the coal bed. By doing this two important things were accomplished: 1. All drainage can be accumulated at one central pumping station by gravity. 2. The loaded mine cars are all brought to the loading point on favorable grades, thus minimizing the haulage expense.

The seam of coal known as Pocahontas No. 3 is about 5 ft. 6 in. thick and runs uniform in height, allowing the use of large mine cars holding three tons each. Electric locomotives are employed to gather the cars and bring them in about 30-car trips to the shaft bottom.



General View of the Tipple and Power Plant

In order that no congestion may occur at the loading point where the cars are put on the cages, double loaded tracks have been constructed, and the cars are loaded singly onto the cages by gravity. This double-trackage system extends back for a distance of some 400 ft., and the roof of the coal bed is supported by 15-in. steel I-beams, placed at 36 in. centers. The same construction is followed for the empty return track for about 150 ft.

---

*Engineer, Link-Belt Co., Nicetown, Philadelphia, Penn.

where the trips are again made up by gravity preparatory to being returned to the working rooms.

It is a well-known policy of this company, of which Howard M. Bertolet is the general superintendent, to secure two essentials in all its operations: 1. Quality is to be primarily considered. 2. Equipment must be as near fireproof as possible.

The tipple is placed immediately over the shaft and is constructed of steel throughout, wood being used at no point except for runways at the side of the railroad cars for the use of the loaders. All other floors, walks, stairways, etc., are made of diamond-checkered steel plates.

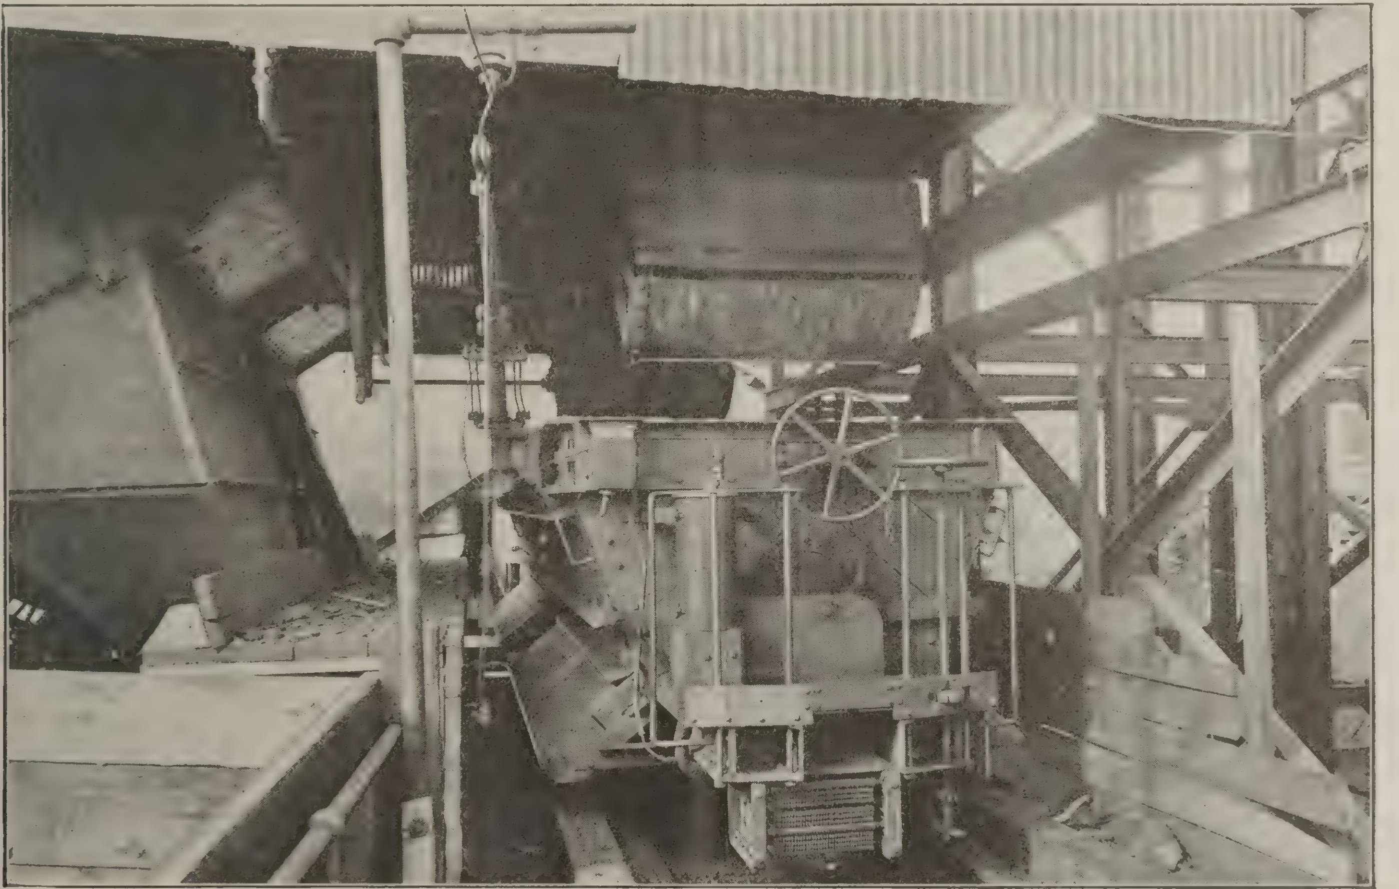
Lepley Cages Are Employed

The Lepley patent self-dumping safety cage, probably the heaviest device of its kind manufactured, is employed to carry the mine cars from the shaft bottom to the elevation of the dumping point. The cars are held in the cage by steel-plate horns, readily opened by the attendant at the foot, to release the empty car and fasten the loaded one preparatory to its being hoisted. As the loaded car reaches the dumping point, it is gradually tilted to an angle of 45 deg., the end gate on the car being automatically opened, so that the only function of the attendant at the top is to inspect the coal and remove the check of the miner from the car and pass it on to the weighmaster in the scale room.

At the top of the structure the 8-ft. diameter bicycle sheaves are placed. These are constructed of heavy cast-iron rims carrying deep V-grooves and connected to the hub centers by steel spokes. In them travels the 1⅜-in. cable, which is attached to the cages at one end and to the hoisting drums at the other, lowering and raising the cages to their respective terminals.

From the cars the coal is discharged into a heavy plate-steel dump hopper, from which it passes into the weigh baskets. Each weigh basket is connected with a 10-ton suspension scale by adjustable forged-steel hanger rods, while the beams are placed in a separate room directly above, in which the weighmaster both records the weight and controls the operation of the basket gates, allowing the coal to move on when released. After leaving the weigh baskets the coal passes over sections of gravity bar screens suspended by hanger rods. These are unveiled, allowing ¾-in. slack coal to pass into hoppers for boiler-house fuel, which when filled close up the spaces between the bars, allowing all coal to pass over them. In this manner boiler fuel is always stored automatically and needs no attention.

A tapered gathering chute, suspended below the screens, centers the coal, discharging it into a double spiral chute, which is provided with a fly gate so that coal may be loaded onto either of two railroad tracks below. A chop gate placed at the end of the spiral chutes allows the railroad cars to be changed when full without spilling the coal onto the tracks. Steel hinged extension chutes are attached to the ends of the chutes and are controlled by hand and geared winches from the loader walks so that high as well as low railroad cars can be filled with minimum drop for the coal.

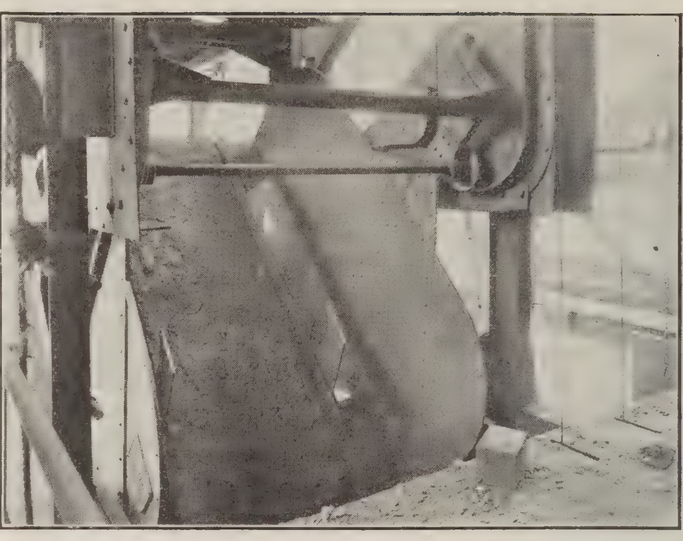


The Self-Propelling Rock Car and Trailer under the Rock Chutes

Self-Propelling Rock Car Handles the Refuse

The ever-present and important problem of disposing of rock and slate is solved as follows: In the dump hop-

Suspended Screens for Boiler Fuel



Lepley Cage in Discharging Position

pers, fly gates are provided, which are thrown open when rock is hoisted. Directly under these gates is placed a common rock bin of about 20 tons' capacity. This is constructed of heavy plate steel and is reinforced with I-beams placed at close centers under the plates. The discharge of rock is controlled at two points by Link-Belt undercut gates.

A feature of the completeness of this plant is the Link-Belt power-driven side-dump rock car with its trailer, each designed to hold seven tons of rock. The discharge points of the rock bin are so placed that they are central over the rock cars when they are coupled together. These cars are built of a skeleton steel frame lined with oak planking on which are placed steel lining plates. They are mounted on 24-in. car wheels with roller bearings. The power car is fitted with a 25-hp., series-wound, interpole, ball-bearing, variable-speed motor, with incased gearing and controlled by a drum situated on the back platform of the car. This car has a speed of from 10 to 15 mi. per hr.

Loading Chutes above Two Railroad Tracks

The control of the side-dump gate is also located on this platform, while the control of the trailer gate is located on the front platform so that the attendant, in addition to running the cars, can operate the gates of both without moving from his position.

An elevated structural-steel trestle extending over the loading tracks to the rock pile forms the runway for the cars, and as the pile reaches the elevation of the tracks they are extended indefinitely, the rock forming the ballast beyond the end of the trestle.

For safety, the entire shaft opening is surrounded at surface elevation by a steel-picket fence with gates which are kept locked. Supplies are taken into the mine at this elevation, and at such times the empty cages rest on sets of cast-steel landing dogs which are thrown in place by an attendant.

The entire tipple structure is constructed of solid steel members, giving easy accessibility for painting. Steel loading sheds over the railroad cars extend both in front of and behind the tipple center line for 60 ft., providing protection for the car loaders in bad weather.

Trolley Beams Are Placed Where Needed

Trolley beams with geared trolleys are placed both at the top of the sheave house and over the screens and chutes below, their function being to facilitate the quick removal of sheaves from the top of the building to the ground or any machinery needing repairs. The building is covered with corrugated iron roofing and siding and is provided with a maximum amount of light, necessary walks, stairways, etc.

The tipple complete, including the power rock car and the boiler-house fuel system, was designed and erected by the Link-Belt Co., of Philadelphia, Chicago and Indianapolis.

No picking of coal aboveground is considered, it being cleaned in the mine as it is loaded. Inspection of the coal occurs both at a point where it is dumped and as it passes into the railroad car.

The power house, which is constructed of stone, adjoins the tipple at a distance of about 60 ft. The roof is constructed of steel framework covered with corrugated iron. This building is well lighted and ventilated. The floor around the boilers is of concrete.

The boiler house contains two 300-hp. Stirling boilers with underfeed stokers and Williams automatic feed-water regulators. The boilers are connected to the brick chimney, which is 150 ft. high, by steel-plate breechings. The stokers are supplied with coal as follows: The slack hoppers under the screens in the tipple discharge the slack coal into a conveyor consisting of malleable-iron flights suspended on a single strand of chain traveling in a steel trough. This extends upward from the tipple and over a set of steel hoppers holding three tons of coal each, located directly in front of and above the boilers. By means of chutes and gates, coal is automatically fed into the receiving hoppers of the stokers.

The generating equipment comprises two 150-kw. steam-driven units and one 300-kw. motor-generator set, power for this latter unit being received from the Appalachian Power Co.'s system, which is fast being extended throughout this region.

The brick hoist house is located directly behind the batter posts of the tipple. It contains the two 24x42-in. Vulcan steam engines, which are direct-connected to two 10x8-ft. conical drums. The attendant has a dial in front of him with a pointer mounted thereon, showing him at all times just what position the cages are in, from which he is able to determine exactly where to stop the engines.

O. M. Knouff is the superintendent of this mine, assisted by J. L. Ascough as mine foreman and R. M. Lambie as fireboss.

⁂

Extracts from a Superintendent's Diary

Today has been a Blue Monday. Things began to happen early. In attempting to start the hoisting engine at No. 2 shaft this morning the engineer wrenched one of the cylinders entirely free from the guide barrel and we won't be able to hoist another ton of coal for several days at best.

Last Saturday was payday, so the engine had been standing nearly two days and quite a quantity of water had condensed in the steam line between the throttle and the separator. For some unaccountable reason the enginer gave the engine full steam on the first stroke and the water did the rest.

As soon as I learned of the accident my impulse was to discharge the engineer, but on second thought I decided that he would be the last man on earth to tear up another engine, so I changed my mind. Several years ago we had a similar accident, and I paid the engineer off and ordered him out of camp as soon as I became convinced of the cause of the accident. Had he been retained, today's accident would probably not have occurred.

In recalling that occurrence of several years ago, I am reminded that the engineer was not the only one who lost prestige on account of that accident. My experience along mechanical lines had been rather limited and the possibility of wrecking a hoisting engine with a slug of water had never occurred to me.

The engineer took advantage of my ignorance and after the accident insisted that a flaw in the engine casting coupled with a poorly designed frame was responsible for the accident. His contention looked reasonable enough, so I hurried to the office and sent a long telegram to the builder describing the break, and to insure proper consideration, I intimated in the message that they would not get a look-in on future purchases of our company unless they adjusted the matter promptly and to our entire satisfaction.

The president of the engine company arrived in our camp the following day, in answer to my telegram, and he was accompanied by the president of our company. They lived in the same city—in fact were neighbors.

The hoisting engineer and myself were still examining the wrecked machine, wondering how we might make a temporary patch, when the two presidents arrived. After introductions all around, Mr. Avery, of the engine company, took our engineer in hand and began to ask questions.

Did the accident happen on the first trip Monday morning? Had the engine been standing since Saturday afternoon? Did he start up slowly and listen for water? Did he suppose that the relief valves could relieve a cylinder full of water? The hoisting engineer was game enough, but he realized that the whole truth would have to come, so he made a clean breast of it and admitted that water was the cause of the accident.

That satisfied Mr. Avery, but the president of our company, Mr. Small, was far from satisfied; what he wanted to know was why it had been necessary to bring Mr. Avery all that distance to do our investigating.

Mr. Avery, realizing no doubt that Mr. Small was in a fair way of becoming fretted, came to my rescue. He assured Mr. Small that a superintendent couldn't be expected to know as much about a hoist as the hoist builder, and as a matter of course the first thing that suggested itself to any man having trouble with a hoist was a telegram to the builder. I still feel friendly toward him.

⁂

The Teton Basin, Idaho, Coal Field

From time to time during the last six or eight years there have been persistent rumors that a large field of high-grade coal lies southeast of St. Anthony, Idaho. As the development of such a field would be of great advantage to a large tributary region containing extensive mining and agricultural developments, and as samples from the field seemed to corroborate the rumor regarding the quality of the coal, E. G. Woodruff, of the U. S. Geological Survey, made an examination of the field to determine its prospective value.

He found that the reports concerning the quality of the coal were substantially correct, but that the beds are so broken by faults and the area known to be underlain by the beds is so small that the field will probably never supply more than the local market and cannot become a factor in the development of the general region of the Snake River Valley. His report has been published as Bulletin 541-I, a copy of which may be obtained free on application to the Director of the Geological Survey, Washington, D. C.

Mining Laws and Legislation

SYNOPSIS—An address delivered by J. T. Beard at the semiannual meeting of the Kentucky Mining Institute, held at Louisville, Ky., Dec. 4 and 5, 1914. General review of efforts made to improve mining conditions. Deficiency of state mining laws in respect to the clear and specific definition of terms used in the law describing mining conditions and requirements. The need of an equable classification of mines. Mining examinations and certification of mine officials.

Mr. President and members of the Kentucky Mining Institute: I always consider it a great privilege to be asked to address a mining institute or any gathering of men who are greatly interested in the many subjects of economic mining. The very fact that you have an institute here in Kentucky—the fact of its existence is evidence of the progressiveness of Kentucky along the line of intelligent, economic and safe mining. We have been, as you know, for many years endeavoring to improve mining conditions, which at the best are arduous. We have of late years done a great deal in the way of first-aid and educational work.

It seems to me that in our efforts to improve mining conditions we frequently view the subject too much from our own standpoint. The operator is prone to consider the economic aspect as most important and in doing this is brought face to face with the problem of rightly informing his officials and the men in charge of the work. But he often goes further than that. Many companies, as you know, have undertaken sociological work and have done much to improve mining conditions both in the home surroundings of their men and in their educational advantages. They have accomplished much in that respect, and great credit is due them for their efforts.

When your secretary wrote me some time ago and asked me to prepare a paper for this meeting, he gave me the privilege of selecting my own subject. I wrote him that I would not be able to undertake the preparation of a paper with the work already in hand; but would be glad to help in any way I could in pushing along such work as you gentlemen are doing. I wrote him that I would be glad to give a brief address along the line in which I had been interested lately.

Intelligent Control of Mining Conditions

Referring to this question of improvement, it seems to me that, while we are interested deeply in educational, first-aid and sociological work and the improvement of social conditions among the men, mine laborers and mine workers, we overlook what might be called a fundamental element; and that is, using proper means to put our operations under such conditions that they can be intelligently controlled. This thought brings us at once to the consideration of existing mining laws and mine regulations and needed mine legislation.

Many of our states have admirable mining laws in some particulars, while in others they are not so good; and yet there is scarcely a single state whose mine laws are anywhere near perfect. They sometimes err, and perhaps chiefly so in not being *specific* in the definition of the terms used in the laws. They err again in not giving sufficient authority to the men—the officers whose duty it is to see that the laws are enforced. I may say that this is one of the greatest difficulties that confronts the mine inspectors in the state of Pennsylvania today. According to the testimony of the majority of state mine inspectors, it happens frequently that when they attempt to enforce a law standing on the statute books they find themselves helpless to do so. It often occurs that either the influence of politics, controlling or restraining the court, or some technicality in the wording of the law renders them helpless to enforce the very law that in their judgment should be enforced in order to make the mine safe.

Uniform Publication of State Mining Laws

Recently I have been looking through the mining laws of the different states; and just here I want to make the suggestion, gentlemen, that all mining laws should be printed in such a shape that they can be distributed and carried about in a small convenient form. So many of these state laws are printed in a large and bulky shape. Your law in Kentucky is in a convenient form; but the laws of many of our states are published in a form that cannot be distributed. This is not the fault of the mining department, but is largely due to a lack of appropriation to print the laws or to print them separate from other reports. I remember that a few years ago the laws of Alabama could be obtained only in such a large or bulky form that it could not be carried around or referred to conveniently.

Many of the state laws are not indexed, so that we find when we undertake to look up a particular question there is no way to refer to it and find it quickly. The mining law of Tennessee has a marginal index. I want to compliment you gentlemen and particularly your chief, Professor Norwood, on the indexing of the Kentucky mining laws. I believe I have never picked up a pamphlet of mining law that is so well indexed as this mining law of Kentucky.

Need of Specific and Clear Definition of Terms

Speaking of the lack of specificness and clearness in the definition of terms in mining laws, I want to refer briefly to one or two points, though many others will occur to you gentlemen. As I told your secretary, I think that more can be gained by a heart-to-heart discussion of mining laws, or of any subject for that matter, than can be gathered from the reading of a prepared paper. One point worthy of careful consideration, in respect to improving our laws, is that in relation to clearness of definition. Let me ask, How many of the mining laws of the states clearly define what is meant by a gaseous mine? As you are aware, the laws of the states commonly classify the mines in such a manner that those mines designated as "gaseous mines" are subject to restrictions and measures that call for an increased outlay and increased expense of operation; and these restrictions fall as a burden on the operator if his mine is classed in that category.

Classification of Mines

In many cases, the laws of the state leave the question of what is meant by a "gaseous mine" so indefinite that it throws the whole burden of classification on the mine inspector. He must say, according to the law, whether or not a mine is a gaseous mine. That difficulty, I believe, exists in your neighboring state of Tennessee. The mines in that state are divided into four different classes, A, B, C and D, and are classified in such a manner that the mine inspector must determine what mines fall in class A, as a gaseous mine, or belong to class B, and also to determine whether or not that mine is more dangerous from having an accumulation of dust. Now, the only distinction that the Tennessee law makes in class A mines is that they generate sufficient gas to be detected on a safety lamp—I believe that is the reading of the law. But I don't think that it states just where or when, thus throwing the whole burden of classification on the inspector.

In your Kentucky law there is a specific classification in that regard. "A gaseous mine is one in which the percentage of explosive gas exceeds three-fourths of 1 per cent. in the return airway of any one split in a dusty mine; or exceeds 1¾ per cent. in the return airway of a split in a non-dusty mine." That is a very good provision and an excellent definition. It gives a specific method for the classification of the mine. The Tennessee law simply says that the mine to be classed as "gaseous" shall generate sufficient gas to be detected on a modern testing lamp, without stating where or how. We all know there are numbers of lamps for testing for gas, some claiming to detect gas as low as one-half of 1 per cent., and others three-fourths of 1 per cent.; and if I read the law rightly, such indications would have to be regarded as determining the classification of a gaseous mine, but subject of course to the final decision and ruling of the mine inspector.

A Practical Illustration

Imagine, gentlemen, for a moment the mine inspector approached by a company. He sees the superintendent or the manager and tells him that he has detected gas—we will say possibly 1 per cent., possibly 1½ per cent. He has detected gas, and it falls under the classification "A." The superintendent calls up his foreman and with the inspector they go below, where the inspector shows them that there is gas. The superintendent explains that it is "only in one place" and after awhile prevails on the inspector to let the classification stand as it is, and the inspector reluctantly complies, as he has that authority. But the conditions change before the time arrives for the next inspection, and that small amount of gas has increased—indeed is coming in other places. Still there is no change in the classification of the mine, and the restrictions with regard to gaseous mines are not made, because the operator is not compelled to meet them.

Of course, we all know that many of these conditions in coal mining throw a burden on the operator; and unless it is necessary for the safe operation of the mine, the law ought not to be so specific as to impose the burden. The first condition in coal mining, however, we must all admit, is to make the operation safe. It is admitted quite generally in print that "safety is the first consideration"; but we know—many of you know that miners are prone to run much risk. Perhaps there is no industry in which the industrial workers themselves are given to taking greater risks than in coal mining. It is therefore a question just how specific the law should be—it is a question for you gentlemen to discuss, to enable you to reach some intelligent and capable understanding, as to what is necessary to make operations in coal mines safe. It is a difficult question; it is a hard question.

In studying this question of law in relation to mining, we must bear in mind one thing and that is when we make a law it must be drafted and enacted in explicit terms, so that an unnecessary burden is not thrown on any one man or class of men. No one appreciates that point more than the mine inspector. No one more than he feels the importance of clearly defined mining laws. When he is called upon to stretch his conscience—when he is called upon to underclassify a mine that he knows and his better judgment tells him should be classified as a "gaseous mine"—when he is urged on one pretext or another to place the mine in the lower class in order that it may be operated at a less expense, the mine inspector would rejoice to have such a specific law as I am talking about.

Mining Examination for Certificates of Competency

As I have said these are difficult questions and I, for one, would not attempt to suggest a solution. They are questions that must be freely discussed and carefully considered. One question of great interest in the same connection is the examination for certificates of competency to act as mine foreman, assistant mine foreman and fireboss. For fifteen years, I believe I held nearly every position in a mine and performed all kinds of mine work except digging and driving. For the past twenty years, my time has been devoted to the education of mining men, particularly mine foremen and firebosses, by classes, by private instruction work, by correspondence and in other ways. I have tried to assist them in some way, if possible. to a more intelligent method of performing their work. Just how much I have accomplished, it is not for me to say. But the matter of examination for certificates of competency is one that comes right home to me. I know what it means to a great many mining men, having been secretary of the Iowa State Examining Board for a number of years.

Let me illustrate: Here is a man who has been serving as mine foreman with more or less success—a good, practical man. But conditions arise in the mine that he is unable to combat, because he doesn't understand them; and he naturally and necessarily endangers not only his own life, but the lives of others working under him, simply through his lack of knowledge. It may seem hard to say that the law should require the examination of mine foremen and their certification because these men are mostly practical men with no knowledge except what they have gained in the mine. But when we look at it from the point of safety it is not so hard, because we know that the conditions of mining in this country and elsewhere have so increased in their danger within the past few years that it is necessary that we should understand more about the *theory* and *principles* of mining.

Changes in Mining Work and Equipment

The equipment of mines has changed wonderfully in recent years. Take the question of installing electricity or the use of gasoline engines and locomotives in mines. We don't all agree on the question of gasoline locomotives for mining use. Many hold that it is the most economical machine that can be put into a mine for the purpose of hauling coal. It is certainly very flexible and economical, but it cannot be denied that at times, under conditions incident to mining, it generates a dangerous amount of gas and if the ventilation is deficient becomes a dangerous factor in the mine. It is necessary that mine foremen should better understand these points. It is necessary that they should understand the influence of *dust*. Until recently, how few of our mine foremen have considered dust at all dangerous? Even at the present time I meet many mine foremen who do not regard mine dust in the sense in which it should be regarded.

Some States Hold No Examinations

But speaking of examinations, as we all know, many of the coal-mining states do not have examinations. West Virginia has no examination required by law, but it is the practice of the Department of Mines of West Virginia to demand an examination of all mine foremen. And this has received the hearty support of most of the coal operators in that state. When Mr. Paul, who read the last excellent paper, was the chief of the Department of Mines in West Virginia, I believe he demanded an examination wherever he could force it upon the operator. But the practice is now quite general throughout the state although not the law. The same is true of Ohio—the law does not require the examination of mine foremen. In Indiana the examination of the mine foremen is in the hands of the mine inspector, as required by law. I believe here in Kentucky the examination is in the hands of your excellent chief, Professor Norwood.

Character and Purpose of Mining Examinations

What appeals to me most strongly is the character of these examinations. Examining boards, in the majority of cases, are politically constituted. These boards are largely composed of men the majority of whom do not fully understand the questions they ask, and their vote to pass or not to pass a candidate's paper is based on their limited knowledge of the candidate's written answer. I have frequently criticized questions asked by state examining boards. Some of the questions put to candidates in examination could not possibly be answered, and yet the candidate is expected to give an answer. We are frequently confronted with a question that is absurd.

When you think of it, the purpose of an examination is not only to find out what a candidate knows, but what he doesn't know. In this matter we are up against the question of the ability of the examiner to pass on the questions asked intelligently himself. Many a time I have had the answers given in their examination papers sent to me by candidates who had been through the examination, but had failed to pass. They asked me to kindly look over the paper and pass on the questions. I never like to do that, but in some cases have done so. In one instance in one of the Western states, I was called by the governor and asked to go into the matter of the board's markings with him. I think he was thoroughly interested in the complaint of a candidate and wanted to know wherein the paper was incorrectly marked. I did so and went through the paper with him. It took a little time, but it was very interesting work, as he was wholly satisfied that an injustice had been done candidates in the method of marking adopted by the board.

The fact that a candidate does not pass an examining board does not in any wise prove that he is not well informed on the theory of mining. My experience in connection with examining boards, private instruction and correspondence work has been perhaps as varied and as long as most men engaged in coal mining, since for the past 30 years I have been much interested in this subject. I regret to say that in 1885 and 1886, when Secretary of the Iowa Examining Board, we passed some men that I could not conscientiously pass now. At one time when Governor Boise, a Democrat, had been inducted into office (the examining board, of course, was largely Republican, holding over from the last administration), we passed certain candidates by the adoption of rules which, though legitimate, were at the same time not fair to all candidates. I say that frankly; and that is the common experience of most examining boards. In nearly every instance they are governed, to a greater or less extent, by politics or political influence.

Appointment of Examining Boards and Requirements

Going back, now, to the question of what ought to be required of examining boards, let me say that they should be men who are technically qualified to pass on the questions they propound. I believe that most thoroughly, gentlemen. Now, in reference to the matter of the appointment of examining boards. As you know, the board frequently is composed of one engineer, two mine operators and two miners. As a rule, the members of the board who are miners know nothing about many of the questions and often the superintendents know little more.

Miners should hold certificates to be eligible to appointment as board members. Superintendents appointed as board members should also hold certificates. Engineers, of course, if they are competent are supposed to be qualified as engineers and to understand the theory of mining and to be qualified to pass on technical questions, but this is not always true. Some self-styled engineers are only practical men. That operators, superintendents or miners, to be eligible as board members, should be qualified from having passed a similar examination themselves, I conclude after giving much time and thought to the subject. I think it should be a requirement that should be read into every mining law in every coal-mining state in this country.

Mr. President, there are many other points that could be discussed further along this line, and I would appreciate it if these gentlemen would follow in such a discussion. I believe that a great many present could discuss these questions in a way that would be valuable to all of us and especially to this Institute, as well as to this state and to the country.

You are justly proud of Kentucky, and in closing I cannot refrain from repeating a little verse that I found in one of your papers as I was coming on the train. It warmed my heart as I read it, and I hope it will make you feel as good as it made me feel.

KENTUCKY

Not the oldest, nor yet the youngest;
Not the richest, nor yet the poorest;
Not the largest, nor yet the least
  But, take it all in all—
For men and women,
For flocks and herds,
For happy homes and loving hearts—
  The best place outside of heaven
  The good Lord ever made.

Successful Use of Refuse Coal

By E. B. McConnell*

SYNOPSIS—Bone coal possessing a large heat content is often rejected from picking and preparation plants in great quantity. The disposal of this refuse is an item of considerable expense at many plants; others are successfully employing it as a boiler fuel through the installation of shaking grates.

The careful sizing or preparation of coal for market is comparatively new so far as bituminous fuel is concerned. It is becoming more popular, however, as time goes on, and most mines now opened embody some kind of preparaplant.

During the recent depression in the coal business the mines that thoroughly clean their coal have sold their product, while those that do not either operated from one to three days a week or closed down entirely. Purchasers refused to buy coal containing a large percentage of ash.

The type of preparation plant employed and the amount and thoroughness of the preparation vary widely with the kind of coal mined and the number and size of the slate bands, partings and bone present in the coal measure worked.

However advantageous it may be to the consumer to be able to secure "clean" coal free from bone and slate the question of the economic disposal of these impurities is one ever present with the operator, and the manner in which the problem is solved sometimes has no small bearing on the cost sheet.

In many instances the refuse from the picking table contains as high as 40 per cent. or more of fixed carbon and from 25 to 30 per cent. of ash. This is not of course pure bone or slate, but is composed for the most part of thin pieces of bone, slate or rock to which the coal adheres tenaciously upon either side. No means of freeing this bone from the adhering coal has yet been devised which can rightly be termed a commercial proposition. While it is true that separation may be accomplished by hand work, its cost is disproportionate to the results obtained.

In the Thacker and Kenova fields in West Virginia and Kentucky there are partings from 2 in. to 6 or 8 in. thick of alternate layers and from 1/8 to 3/8 in. thick of low-grade slaty bone and the best quality of coal. This is known as laminated bone. These thin layers cannot of course be separated, and recently purchasers have insisted that this material be entirely rejected.

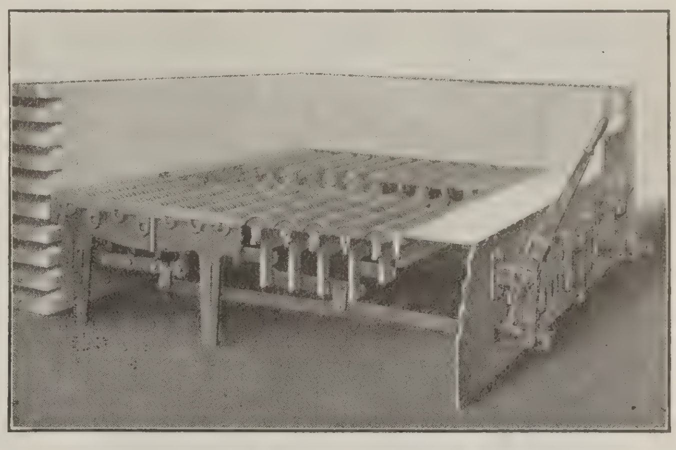
Refuse with 40 per cent. of fixed carbon and, say, 30 per cent. ash has a definite fuel value; but this is difficult to secure through the medium of ordinary hand-fired, stationary-grate boiler furnaces because the ash content is so high that this inert material soon accumulates in such quantity as to choke the fire and render frequent and almost incessant cleaning necessary.

Some Stokers Are Successful Bone Burners

Some types of automatic stokers are so built as to be fairly successful with high-ash fuels. Preëminent among these are chain-grate stokers, which dump the ashes over the back of the grate continuously, also those varieties which are provided with a dumping plate at the rear of the furnace by means of which the ashes are precipitated into the ashpit at frequent intervals.

The high cost of these stokers practically prohibits their use in the small coal-mine power plant, where there can be no saving in labor to counterbalance the interest on the investment, and therefore few coal-mine plants are equipped with automatic stokers of these types.

In the ordinary hand-fired plant the great problem in burning high-ash fuel is to keep the ashes from accumulating on the grates and shutting off the air-supply. This difficulty may be overcome by the use of shaking grates, such as the Ajax manufactured by the Valley Iron Works, Williamsport, Penn., by means of which the ashes may be frequently shaken through into the ashpit.



Constructional Details of the Ajax Grate

Many mines have successfully solved the problem of refuse-coal disposal by means of these grates. For more than four years the power plant of the Derry No. 1 mine of the Latrobe-Connellsville Coal & Coke Co., at Latrobe, Penn., has used as fuel nothing but refuse from Bradford breakers containing from 45 to 50 per cent. of fixed carbon and from 25 to 30 per cent. of ash. The mines of the Cascade Coal & Coke Co., at Tyler and Sykesville, Penn., for more than three years have burned breaker and washer refuse containing about the same proportions of carbon and ash as the fuel just mentioned.

The power plant of the McCandlish mine of the Hutchinson Coal Co., at Meadowbrook, W. Va., for more than a year has used as fuel nothing but bone coal, consisting of a slaty parting with good coal adhering to both sides. C. J. Ryan, general superintendent, reports a saving of $200 per month in fuel cost at this mine.

Bone coal is also burned at the Hutchinson mine at Mt. Clare, W. Va. The Grey Eagle Coal Co., Kermit, W. Va., is burning all the laminated bone it produces, which is about one-half of all the fuel used. The fires have never been cleaned through the fire-door, but all the ashes have been shaken through the grates and taken out of the ashpit. The McAlpin Coal Co., McAlpin, W. Va., the New River Collieries Co., at Eccles, W. Va., and numerous other mining firms burn all the refuse rejected

*207 Fulton Building, Pittsburgh, Penn.

from the mine output in the cleaning and preparation processes.

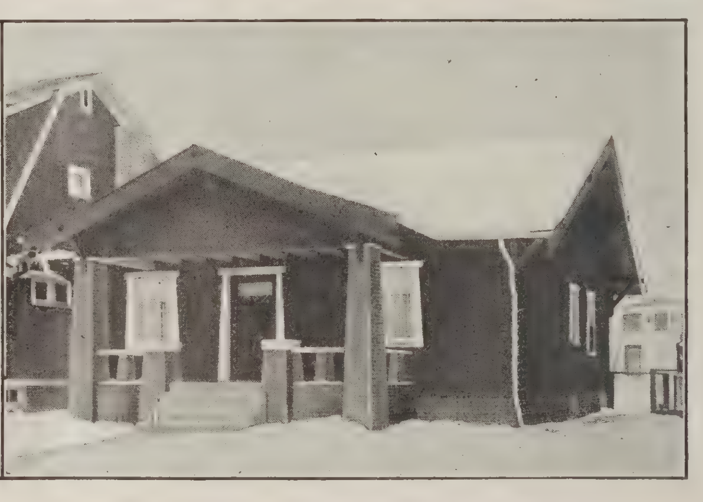
It is a grave question whether many mines that now purchase current from a central-power station could not produce it more cheaply by burning the refuse bone coal now thrown away. They might also afford to clean and pick the output more thoroughly and thus secure a cleaner product if an economic use could be made of the "pickings."

Miners' Homes

Building houses is a specialty just as much as any other work. No engineer of mines wastes his time designing a pedestal block for an engine or planning a steam hammer. He may prepare rough specifications, but he leaves the details to the manufacturer, and in most cases a specification is merely a trap for the coal company which involves it in difficulty rather than saves it from losses; for the mining engineer is not a machine designer, nor is he a builder and architect.

It is far better to get a house supplied by a concern which troubles its mind with no other problems and can afford to make the necessary variety of residences because it makes 20 or more houses every day. There is no reason why a company cannot be relied on to supply a suitable house from its own plans and specifications just as we can feel assured that we will receive a satisfactory engine from a reputable engine-building firm.

Simple Five-Roomed House

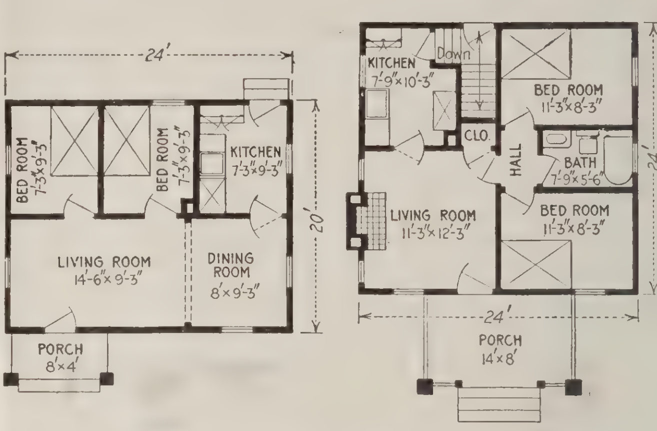


House with Striking Individuality

A concern which ships a knock-down house direct to the purchaser saves in freight because it only ships useful lumber and not waste material, and it also saves in material, because it can scheme to reduce waste in cutting. Seeing that the cutting is done by special machinery instead of hand tools the cost of framing is divided by three. The time in which the house is erected is also considerably reduced. The design is also almost sure to be superior to the work of a country architect and certainly better than a mining engineer is likely to evolve, for he does not keep himself posted by reading architectural literature.

Such houses can be put up without skilled labor because no framing has to be done, and with full directions sent by the firm supplying the lumber, men with little natural ability and no experience can do the work of erection.

By means of these economies the International Mill & Timber Co., of Bay City, Mich., states it can supply a five-room house with porch and back steps complete from foundation to gable, with all paint and plaster at $390. Two houses are shown in this article which roughly represent the 50 different models which it has on the market. The prices range up to $2213 for a 10-room house.



Plans of the Two Residences Illustrated below

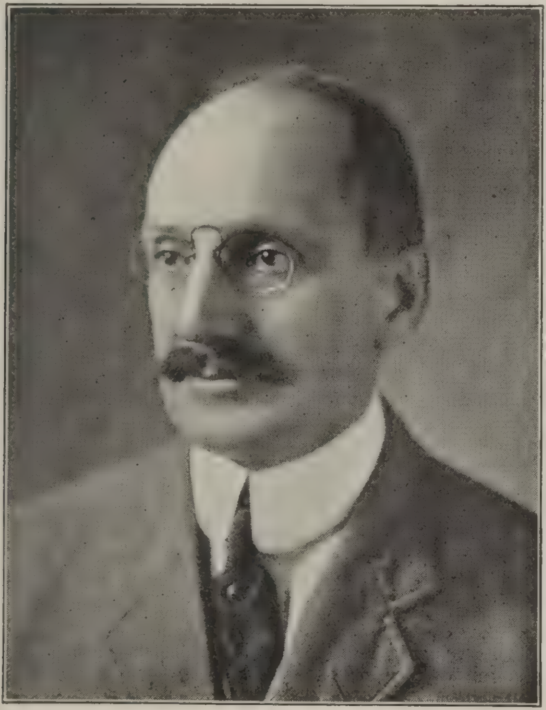
Operators who are encouraging their miners to build could well urge their men to buy houses from this or a similar firm, for they could erect them in their spare time and save the profits to architects, carpenters, retailers, wholesalers and middlemen and furthermore eliminate some rehandling and reshipment of material which occurs when lumber is bought from a retailer. The company is as ready to supply a single house as a hundred and will agree not to sell a similar house to anyone in the same vicinity. In the summer months when the coal trade is dull thrifty employees would have a splendid opportunity to erect their homes with but a little help for bricklaying and for plastering if plaster-board is not used.

If the operator is contemplating starting a band in his mining village, he will not consider securing a tailor to furnish the uniforms, but he will write to a uniform-furnishing house. Similarly, if he does not own a merchantable forest or a lumber yard, he will do well to buy his houses by mail order as he would buy the band its suits. Since it is not necessary to fit the house to the lines of the tenant, it is really easier to buy a knock-down house than to purchase a clothing outfit.

Change in the Bureau of Mines

Herbert M. Wilson, engineer in charge of the Pittsburgh Experiment Station of the United States Bureau of Mines, has resigned from the Government service to become director of a newly formed organization to be known as the Coal Mine Insurance Association.

Mr. Wilson was closely associated with Director Joseph A. Holmes in the inception and development of the Bureau of Mines. Early in 1907, when Secretary James R. Garfield added a technologic branch to the United States Geological Survey, Director Charles D. Walcott of the Survey selected Joseph A. Holmes as chief of the new division and Mr. Wilson was appointed as his principal assistant. With the creation of the Bureau of Mines, Mr. Wilson became engineer in charge of the Pittsburgh station, a position which he has held ever since.



H. M. Wilson

Mr. Wilson was educated in mining as well as in civil engineering, graduating from the School of Mines, Columbia University, New York. He has spent the last eight years in developing mining experiments, including the use of explosives, experimental investigations in electricity and lighting, and especially in the mine-safety, mine-rescue and first-aid operations of the Federal Bureau of Mines. As evidencing his interest and activity in matters of safety, he is on the advisory council of the Underwriters' Laboratory, Chicago; he is one of the organizers and is on the executive committee of the National Safety council and was the first president and is now the secretary-treasurer of the American Mine Safety Association. He is familiar with the coal-mining industry in every state, having personal knowledge of many of the mines.

The Coal Mine Insurance Association, of which Mr. Wilson is to be the director, is a combination of ten American and British insurance companies that have associated themselves for the joint underwriting of coal-mine accident insurance.

An extended review of Mr. Wilson's life was published in Coal Age, Jan. 31, 1914, Vol. V, pp. 204 and 205.

The Labor Situation

Owing to the improvement in business many plants are resuming operations in eastern Ohio, where the 13-month strike was recently settled. About one-third of the miners in the district are now employed, but they are probably not working full time. However, the work of preparing other mines for operation is being rushed, and before long most of the plants in the district will be working.

The officers of district No. 5, which comprises the eastern Ohio field, are endeavoring to sell or lease several thousand tents bought to house the miners against whom eviction notices were issued last winter. The men were never evicted and the tents were not used. The money received from the sales is being expended in "strike" benefits for those still unemployed.

The men at the Wheeling Creek mine of the Lorain Coal & Dock Co. have refused to work on the basis of an allowance of 33⅓ per cent. for the slack which passes through the screen and is accordingly not weighed. There will probably be no more work until the tipple is remodeled, so that all the coal mined can be weighed and paid for at the run-of-mine rate. Some other mines are working on this basis, and some have already made arrangements to weigh the coal in bulk.

The actual slack content in eastern Ohio is 36 per cent. But the miners insisted they were making an equivalent contract when they replaced a rate of 69.5c. per ton for screened coal by 47c. per ton for run-of-mine. This would have been a fair equivalent had the slack content been 32.37 per cent.

Some operators have endeavored to arrange temporarily for a percentage somewhat more liberal to the miner—namely, 33⅓ per cent. As a matter of fact the miner knows he has made an advance in the rate per ton in return for other concessions, and he cannot see why the operator, whom he has been contradicting, should now proceed on the basis that the miners' contention was correct. The miner refuses to be "hoist with his own petard," forgetting that he has for months asserted that his petard was a harmless firecracker.

Coming Meetings

Illinois and Wisconsin Retail Coal Dealers' Association will hold a convention June 23-24, at the Jefferson Hotel, Peoria, Ill. Secretary, I. L. Runyan, Chicago, Ill.

West Virginia Coal Mining Institute will hold its summer meeting at Wheeling, W. Va., June 15 and 16. Secretary, E. N. Zern, Morgantown, W. Va.

Pennsylvania Retail Coal Merchants' Association will hold its 11th annual convention at Wilmington, Del., June 15, 16 and 17, 1915, with headquarters at the Hotel Du Pont.

M. O. I. Coal Association's annual meeting will be held June 22-25, 1915, at Cedar Point, Ohio. Secretary, B. F. Nigh, Cleveland, Ohio.

American Society of Mechanical Engineers will hold its summer meeting at Buffalo, N. Y., June 22-25, 1915. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

American Mine Safety Association will hold the following meets: July 2-3, Big Stone Gap, Va.; July 23-24, Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

The Order Kokoal will hold its annual pow-wow at Chicago, Ill., July 13 and 14, 1915.

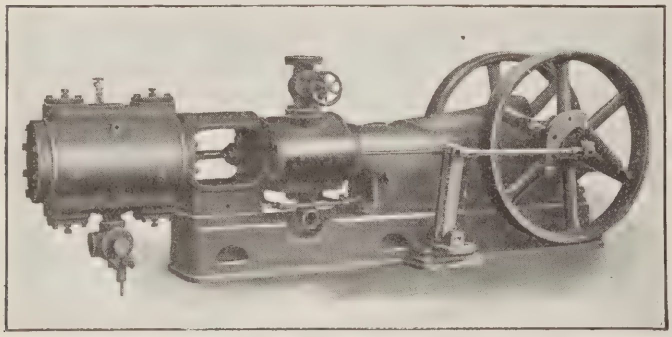
Pennsylvania Retail Coal Merchants' Association will hold its 11th annual convention at Wilmington, Del., June 15, 16 and 17, 1915, with headquarters at the Hotel Du Pont. The first two days of the convention will be devoted to business, including exhibition of coal-handling machinery in action, supplies and motor trucks. The U. S. Bureau of Mines will show by motion pictures every detail of anthracite mining, accompanied by a lecture by Charles Enzian, of Wilkes-Barre, Penn. The "Queen Anne" has been chartered to take the members and their friends on June 17 down Delaware Bay.

New Apparatus and Equipment

Efficient Small Air Compressor

The constant demand for higher efficiency and greater economy, as well as the increasing tendency toward the use of higher steam pressures, has led to the development by the Ingersoll-Rand Co. of the small steam-driven high-speed air compressor shown in the accompanying illustration.

This machine is designed along the same lines as the company's former small steam-driven type, but embodies many improvements which give it a higher efficiency in air compression and a considerably lower steam consumption. These improvements are:



Small Steam-Driven Air Compressor

1. The "Ingersoll-Rogler" air valves, which are now standard on the extensive line of steam, power and electric driven compressors known as the "Ingersoll-Rogler" line. They allow of high speeds, give high compression efficiency, are almost silent in operation and are independent of any operating mechanism. Before adopting the Ingersoll-Rogler valve a thorough test was conducted to determine the life of this type. This test consisted in running a 12-in. stroke compressor 400 r.p.m. over a period of one year, during which time no valves were broken nor any adjustments required. In the two years in which this type of valve has been on the market there has been practically no valve breakage.
2. Balanced-piston steam valves, which type of steam valve was adopted after extensive research. It is designed after the most successful European practice, permits of higher speeds and the use of high-pressure superheated steam, at the same time giving a higher efficiency under ordinary low-pressure steam conditions.
3. Automatic cut-off control, giving the highest possible steam economy under conditions of varying load or fluctuating steam pressures. This control is regulated by a centrifugal flywheel governor which shortens or lengthens the stroke of the piston valve, thus changing the cut-off.
4. Automatic splash lubrication, by means of which all wearing parts are copiously and automatically oiled.
5. Inclosed construction and removable covers, making for cleanliness with great accessibility.

The machine is designed and constructed with great thoroughness in detail. Materials are so disposed as to secure great rigidity without excess weight; bearing surfaces are large and carefully finished. Special provision has been made for ready adjustment of all parts, without loss of time.

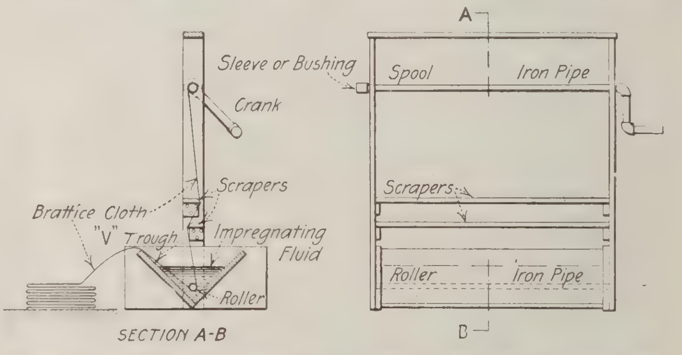
The automatic cut-off control is supplemented by an air unloader, assuring great economy at the same time possessing a high degree of automatism, which is essential in a small compressor designed for severe duty and often subject to considerable neglect.

⁂

Brattice Cloth Treating Rack

By Davis Crow*

The accompanying sketch shows a rack for treating brattice cloth with tar or other impregnating fluids. This rack has been devised and used by B. B. Hollis at one of the Houston County Coal & Manufacturing Co.'s coal mines and is a useful piece of apparatus. By regulating the speed of turning the crank the quantity of fluid taken up by the cloth can be readily governed.



Side View and Section of the Rack for Treating Brattice Cloth

The rack is simple and can be built easily and quickly. All the material required is a few 1-in. boards, strips, pipes and nipples, elbows and sleeves, also a few nails. If tar is used in the trough it flows into the cracks and makes the cloth airtight. The tar must of course be first heated in order to give it sufficient fluidity.

⁂

Use of Silica-Graphite Paint

A practice that is fast gaining adoption in progressive power plants is the use of paint for the inner surface of steam boiler drums. This is said to afford protection against pitting. Silica-graphite paint is used for this purpose, and for a number of years the manufacturers of this paint have coated the steam drums of five B. & W. boilers developing 1800 hp., with the result that the drums are in almost perfect condition.

Another instance is a plant equipped with B. & W. boilers developing 8400 hp., where the interiors of the drums were scalded, painted both above and below the water-line and allowed 48 hr. to thoroughly dry. This treatment was repeated every 10 months, and not only did it stop pitting, but where it had previously taken six men seven days to clean the drums of one boiler, two men now clean them in one day. This latter experience is quoted from a letter of the chief engineer of the New York Life Insurance Co., in the April issue of *Graphite*.

⁂

Improved Method of Bagging Coal

Bagging coal which has to be delivered from a coal yard has always been considered as a sort of necessary evil wherever local conditions at the delivery point rendered the chuting of coal directly into cellars an impossibility. Those yards which are blessed with pockets found the bagging problem comparatively easy, as with an abundant supply of coal overhead the drawing off of the material into bags could be accomplished by one man as rapidly as the bags could be disposed of in the wagon. Where coal was carried in ground storage, however, it was more of a problem. The loading of bulk coal has been reduced to a simple matter by the advent of the mechanical wagon loader, which has completely overcome the handicap of ground storage and brought it up to the efficiency of the pocket.

It only remained for a further adaptation of the wagon-loader principles to simplify the bagging problem. By using an elevator to keep a bagging bin constantly full of coal, the equivalent of bagging from a pocket has been reached.

The Link-Belt Coal Bagger in Operation

The accompanying illustration shows how this has been accomplished. The machine consists in all its essential features of an elevating and screening medium which is identical with that in successful use today on scores of machines loading bulk coal to wagons. The elevator buckets are 16x6½ in. in size and are attached to a double strand of closed joint chain. The screen is of the shaking type, set at such an angle that only by vibrating can the coal be made to flow over it. This slow vibratory motion over the screen insures the coal being thoroughly cleaned.

The motor for operating the loader is of 2 hp., and the transmission is by cut gears throughout. In actual operation with two men bagging from this machine, coal has been bagged at the rate of over 21 long tons per hour, an advance of several hundred per cent. over the tedious method of hand shoveling over yard screens.

The loader is light, and as it is provided with wheels 48 in. in diameter, it is easily moved from one bin to another. The screens are interchangeable for the various sizes of coal from pea to egg, all of which are handled on this machine with equal facility. This loader is made by the Link-Belt Co. of Philadelphia, and embodies the result of many years of experience.

⁂

Economical Method of Making Coupling Pins

A Leyner drill sharpener in the shops of a coal mining company was recently fitted with special dies for forging coupling pins for mine cars. This resulted in a considerable economy of the blacksmith's time.

For this purpose a piece of iron stock 1¼ in. in diameter and about 14 in. long is placed in the dies, projecting about 2 in. The flat-faced hammer or dolly upsets the head, as shown in Fig. 1, bringing down the length of the pin to about 12½ in. The machine operates with compressed air and is controlled entirely by a single lever.

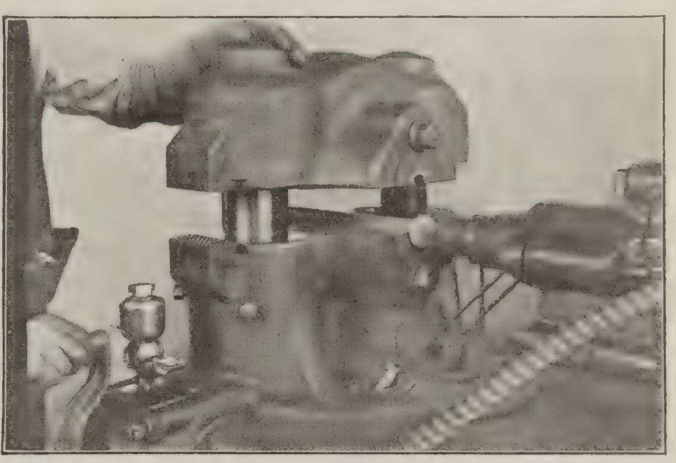

Fig. 1. New Dies and Pin in the Sharpener

By equipping the sharpener with suitable dies and dolly the pins were turned out at the rate of about two per minute. This rate could have been even greater if it were not that there were only three forges in use and they could not supply the heated stock any faster.

Fig. 2 shows the special dies and dolly used for forging these pins, as well as a blank and a finished pin. It is planned to make other special dies and dollies so that the machine can be used for miscellaneous blacksmith work, such as welding car couplings. In addition to this special work, the sharpener is used for pointing various styles and sizes of drill steel used for cutting rock and coal in the mine.

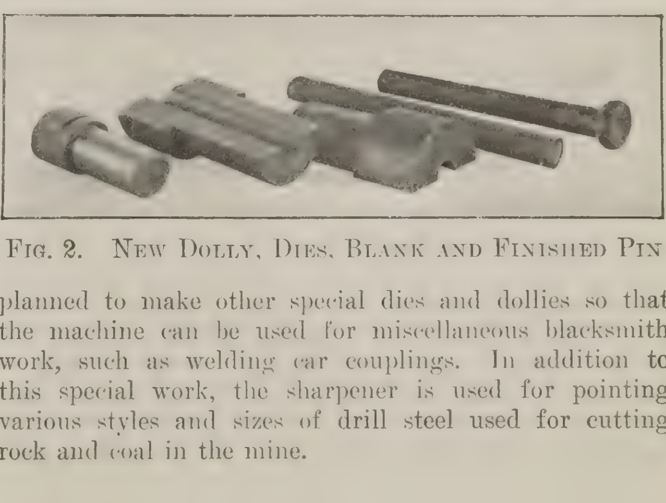

Fig. 2. New Dolly, Dies, Blank and Finished Pin

Editorials

Have You a Lodge?

Not the drinking kind of course, but a benevolent lodge which teaches the brotherhood of man and gives play to the better instincts. There should be no favorites. Masons, Knights of Columbus, Odd Fellows and Maccabees all are good. They teach the brotherhood we all should feel and knit up the community life. Sometimes churches are almost impossible and lodges are not. In all cases it is well to have one if you cannot have both.

For anything which teaches a man about his fellow's rights prevents the clash of interest. Even the unions are not wholly given to destructive energy. They do not entirely labor to pull down what others upbuild.

It is pleasing to notice the recent attitude toward coöperation in store management especially among the unions of Illinois and Indiana. The stores may never succeed—though we hope they will—but if they educate the shareholders they will do an acceptable work. It is sincerely to be desired that they will be prosperous, for they will certainly promote thrift. Unfortunately the irregular operation of the mines makes it difficult to conduct such a business without credit, and it is difficult to give credit without a large bank account. Accordingly in bad times the coöperative stores do little or no business and lose the goodwill of their patrons.

But successful or not, it is a good sign, for it is constructive work, as is also the generous support recently given to first-aid work in Illinois. If the unions thus begin to show a large sense of their duties of citizenship and cease to criticize benevolence as robbery of their rightful dues they will then be claimants like the lodges to the blessings of mankind.

⁂

Powdered Fuel on Railroads

Among the great changes of the future as viewed from the broadest national standpoint will be the use of powdered fuel on railroads if ever that plan is made a success. Everyone should combine to aid this desirable development. In fact, why should not the Bureau of Mines equip a crushing station and, under an arrangement with some railroad, operate a locomotive on a spur of railroad having much heavy traffic, and thus prove what can be done?

The problem interests more than the railroads and is a proper question for national investigation; for when the happy time comes that coal is burned in powdered form the forests will once more be able to grow to maturity freed from the periodical fires formerly started by locomotives. The air along the railroads will be so purified that it will be more possible to have the best of residences facing the track.

Of course the noise of the exhaust would also have to be removed, but even that can easily be done if approached seriously. In fact the railroad engineers, like the mine managers of our forefathers' days, ventilate by exhaust steam, an uneconomical method of creating a draft of air. If the exhaust were used for driving a blower a steady draft would be possible. There are many uses for this steam more acceptable to the general public than that of scattering ashes live and dead over the lawn, porches and weekly wash and over the dead and living leaves of the forest to burn or deaden the trees which are striving to grow.

The mines also will be helped by the use of powdered coal. The loud condemnation of miners for blowing their coal to pieces, instead of mining it, simply because it is unscientific and not in accord with early practice, has always seemed ill-judged. Wherever, and that is in most localities, shooting coal from the solid is under present conditions unsafe it should be unsparingly condemned. Where it prevents coal from entering the market it should be firmly forbidden. But where it is safe and where slack is as desirable as lump coal why condemn the miner to undermine his coal?

The miner is showing that he is not a slave to ancient practices when in the Connellsville region he puts in a blast and shoots the coal from the solid, apparently bringing it down without danger and in such a condition that it is well-suited for coking. Safe methods of shooting even the harder coals from the solid may yet be found as soon as the need for large coal is removed.

We wish to get beyond the time when coal must be mined with such care. We would see it produced cheaply, even though not scientifically, and the use of powdered coal foreshadows the time when coal will be ground out of the hill and handled without the care now devoted to it.

And such coal will be burned with the utmost economy, for perfectly smokeless combustion will result from its comminution. The cost of crushing has always been regarded as a disadvantage, but we believe that the labor cost can be made negligible.

The unfortunate man who now has to be ready to dump coal at irregular moments during the night or day will be made happy by having something to occupy his spare moments—namely, the crushing machinery. He can attend to this work when he is not coaling engines. Of course a more skillful man will have to be chosen, but in the days to come we shall have skillful men everywhere and not in a few selected positions.

Speaking before the International Railway Fuel Association, W. L. Robinson, supervisor of fuel consumption of the Baltimore & Ohio R.R., enumerates 18 advantages in the use of powdered coal, including sustained boiler horsepower; ability to run locomotives for relatively long, continuous mileages or periods; automatic firing; absence of cinders, sparks and smoke; material reduction in cylinder back-pressure through greatly enlarged exhaust passages; saving in inspection, maintenance and operation through the complete elimination of grates, ash pans, dampers, operating gear, smoke-box diaphragms, baffles, netting, spark hopper, hand-hole plate, coal pushers, fire tools, squirt hose and like equipment.

Furthermore he shows that the inclosed fuel container prevents the spilling and loss of coal and keeps it free from snow, rain and other unfavorable conditions; that a more uniform furnace temperature is maintained, reducing the liability of leakage of firebox and flues; and that no special fuel is required for firing up.

He adds that with powdered coal an inferior quality of coal can be used; that the heat losses in combustion are reduced; that fires are not started; that there are no delays for the building, cleaning or dumping of fires at terminals or the cleaning of flues and smokeboxes. Ashpit tracks and ash-handling facilities at terminals and intermediate stations are unnecessary, superheater units and boiler flues will not be clogged, poisonous gas will not be formed by combustion, there will be no cinders and ash in the ballast to cement it together and burn out the ties, and the work of maintaining the fires in a locomotive in fit condition will take less training and involve less labor.

⁂

Obsolescence

It will pay us all to be occasionally reminiscent and to remember how we used to do things around the mine in the close of the past century. Few there are of us who can recall having used electric mine locomotives more than 20 years ago. Most of us will be prepared to assert that wooden rails were not only the standard form of track in the rooms of the mines in which we operated, but also found their way quite freely into the entries. We do not recall seeing kick-back dumps at that early date.

A mine which every one would have thought quite up to date at that time became ten years later entirely behind the times, so rapid was the progress of mining science. Today we are traveling along much faster than we were then, and the prudent mine owner will put his factor for the obsolescence of some of his plant at 10 per cent. per annum. Some equipment of course will hardly live that long, but where it is constantly replaced in some parts and repaired in others it never really wears out. But there does come a time when the old outfit is not worth refurbishment. It will no longer do the work with the new economy demanded.

The little mine car of the last century may still be running and be as efficient or even more efficient than it ever was. Wheels have been replaced; the irons have been renewed; new planks have been supplied. Some trifling changes even have been made in its size—the wheels are larger and more easy-running, the car is better braced, the wheelbase has been increased; but radical improvement involves a larger gage. Such a change demands the transference of the obsolete car to another mine or a bold confronting of the problem of obsolescence and the casting away of valuable later replacements and improvements as well as of those parts which are valueless because it is so long since they have been renewed.

The same is true of the headings, air-courses and shafts. They may be kept in repair and even in some cases improved, but they cannot thereby be saved from obsolescence. In time they become out of date and must be entirely reconstructed or replaced if they are to keep up with modern requirements.

Machinery and boilers in the past wore out almost as fast as they became obsolete. Consequently a generous depreciation allowance was sufficient to make an obsolescent charge unnecessary. But the progress of science is so great that obsolescence will soon be the major item in the cost of amortization, and it will have to be figured not only on constructive details such as headings, shafts, bins, railroad tracks, coke ovens and houses, but on machine units.

The biggest burden of the future will be the burden of reconstruction, but it will be cheerfully borne because of the marvelous economies accompanying it. The progress in mining in the 100 years of the last century was not as important as in the last 20, and it is likely that within 10 years the speed of development will be so great that we shall compress into half a decade the former progress of a century.

In 1895 the mine manager studied mine gases, rope haulage and geology. Today these are relatively negligible studies to a man who has an electric plant, a machine shop, a foundry, coal-cutting machines, a steam shovel and even a sanitation plant on his hands. If he cannot handle these it will avail him little to be an expert on the others.

The man who studies the lore of 1895 is as obsolete as his studies. He must keep up with the progress of the times and constantly remodel his mind, and unless he does he will find that a new man, built like the new mine car on an entirely new model, is the man of the hour.

⁂

Western Coal-Selling Plans

The Indiana coal operators have formed a coöperative selling plan, and concerns whose output aggregates 80 per cent. of the coal tonnage of the state have agreed to market their product through a common selling agency. It is understood that Morton L. Gould, president of the Gould Coal Washing & Mining Co., of Indianapolis, will be the executive head of the association.

Mr. Gould has had many years' experience in the production and sale of Indiana coals. He is one of the most prominent and best-known men in the coal trade of Indiana, and his appointment gives assurance that the plan will be successful. It is now expected that within 60 days the new organization will be in operation, and it is anticipated that its headquarters will be in Terre Haute, branch offices being opened in Chicago and Indianapolis.

The Franklin County Operators' Association, in charge of Dr. F. C. Honnold, with headquarters in the Fisher Building, Chicago, is progressing satisfactorily and receiving unqualified support from all its members. Despite the unusually dull times that have prevailed recently, prices have been well maintained on the basis agreed upon, and the operators composing the organization feel that much good will result from their concerted efforts later in the season.

The Williamson County operators have recently organized an association on the lines of that of the Franklin County shippers. This will be in charge of J. L. Keiflein, formerly secretary and treasurer of the New Kentucky Coal Co. The headquarters of the association will be in the Fisher Building, Chicago, and activities will commence on June. 1.

Sociological Department

Rescue-Work in Illinois

SYNOPSIS—The Illinois State rescue corps having given such an excellent account of themselves at Royalton and elsewhere, a description of their training methods is of interest. A well-equipped corps without training or with its apparatus out of order will jeopardize the lives of its members without effecting any good work.

In January, 1910, after the mine fire at Cherry, Ill., where about 300 lives were lost, a special session of the State Legislature was called for the purpose of considering legislation to promote safety about coal mines. At this session, a bill was passed establishing the Illinois Mine-Rescue Station Commission.

Under this act three rescue stations were established to provide prompt and efficient means of fighting mine fires and to save lives and property jeopardized by fires, explosions and other accidents in the coal mines of Illinois. These stations were constructed, equipped, and have been continuously maintained at public expense, to serve the northern, the central and the southern coal fields of the state.

Lecture Room at Benton Mine-Rescue Station

The control of these stations is vested in a commission of seven members, appointed by the governor of the state, including two coal-mine operators, one state mine inspector, one representative of the department of mining at the University of Illinois and one representative of the Federal Bureau of Mines. After the organization of the commission, sites for the stations were selected at La Salle, in the northern district, Springfield, in the central district, and Benton, in the southern district; and a superintendent and assistant superintendent were appointed for each station.

At the time of the building of the stations, the commission also acquired three cars—one by purchase from the Pullman company, one donated by the Chicago, Milwaukee & St. Paul Ry., and the third the gift of the Chicago & Northwestern Ry. The last two cars were fully equipped by the railroad companies, the one purchased by the commission being outfitted by that body from its own funds.

These cars were attached to the stations, a suitable barn for their storage being built on the station grounds and a track being run in from the nearest railroad. These cars have lately been taken from the road, and the equipment from them has been used for the establishment of substations at Herrin, Harrisburg and Duquoin. The cars are kept on mine spurs in the towns where the substations are located, so that the equipment can be taken easily to any place from which a call is received.

The equipment at the six stations is as follows:

Breathing apparatus: Fleuss type—Proto, 41; Salvator, 6; Smoke helmet, 3. Draeger type—2-hr., 18; ½-hr., 12. Westfalia type—2-hr 7..

Oxygen pumps: Draeger type, 6; Fleuss type, 3.

Safety lamps: Electric—Hubbell, 44; Draeger, 3; Fleuss, 2. Oil—Hailwood, 12; Wolf, 25; Davy, 6.

Testing apparatus: Fleuss meter, 4; Draeger water gage, 6; Draeger testing bag, 3.

Pulmotors, 6; mine cages, 3;

In addition to this standard apparatus, the teams at each station have been provided with special apparatus as follows:

Two canary birds, 1200 feet of life line with reel, 1 gross of chalk, 7 signal horns, 1 thermometer, 2 hatchets with shields and belts, 1 8-lb. sledge, 1 saw, 7 flash-lights, 2 lb. of nails and rolls of brattice cloth.

Until September, 1914, the work at each station was done by the superintendent and his assistant, relying on such certificated men as could be secured on call. Realizing that they could improve this method of working, the commission ruled that there should be at each station a team of five men, who would take regular training in rescue and first-aid work and who should sign an agreement to respond to all calls received by the station. The value of such a team was proved when the Benton station received a call at the time of the Royalton explosion. On that occasion eight trained men from the station arrived at the mine in less than three hours from the time when the call was received.

When the cars were kept traveling about the state, a minimum of six days of training was required before a certificate and a rescue-corps button were awarded to those who were trained. These six days were so arranged that a man made six trips in the smoke gallery and received 12 lessons in first-aid work. The following test was required of those seeking final certificates as mine-rescue men:

TWO-HOUR TEST

1. Make eight complete trips around the gallery on the ground floor.
2. Make ten trips over the overcast.
3. Carry 25 bricks over the overcast.
4. Crawl through the tunnel three times
5. Carry four props over the overcast.
6. Saw two props.
7. Set five props and knock them out.
8. Hang a canvas, take it down and fold it up.
9. Pull the weight 60 times.
10. Two men carry a dummy once around the gallery, lifting it over a car.
11. Two men push a car once around the gallery.
12. Make eight complete trips around the gallery on the ground floor.

SEVERE TRAINING REQUIRED OF CERTIFICATED MEN

With the formation of teams at each of the stations, a change was made in the method of training, the number of lessons being increased to 12. For the team training, the following schedules have been arranged:

SCHEDULE NO. 1

1. Walk the entire length of the gallery and back again ten times. (This distance is equivalent to a quarter of a mile.)

2. Erect a temporary stopping under the overcast with brattice cloth, cutting two props and a collar the proper length for supports.

3. Two men build a brick stopping 1½ bricks wide, in front of the temporary stopping, the other three men supply them with bricks carried in gunny sacks, 10 bricks to each sack load.

4. Take down both the stoppings and return them to the point where they were found.

5. Alternately pull weight five times and walk around the gallery twice until the 2-hr. period has expired.

SCHEDULE NO. 2

1. Walk ½ mi. and return across country.

2. Enter the gallery in team formation with life line and other regular equipment and restore ventilation by carrying brattice cloth down the middle of the roadway, using one side of the cloth for the intake and the other for the return, always assuming the gallery to be filled with dangerous afterdamp from an explosion.

3. Crawl through the tunnel three times.

4. Take brattice down and return to the point where it was found.

5. Push mine car around gallery and pull weight until the 2-hr. period has expired.

SCHEDULE NO. 3

1. Carry six props over the overcast and set under a collar.

2. Saw off the ends of three props.

3. Carry ten bricks in gunny sacks around the gallery five times, passing over the overcast, and leave them at the point where they were found.

4. Carry dummy which weighs 150 lb. over the overcast and around the gallery on a stretcher.

5. Substitute a man for the dummy and give artificial respiration by the prone or Sylvester methods.

6. Use a pulmotor on the patient.

7. Alternately pull the weight and walk around the gallery until the 2-hr. period has expired.

SCHEDULE NO. 4

1. Enter gallery in team formation with the life line and other regular equipment, including one ½-hr. apparatus. Each member of the team will assist in carrying this outfit, being relieved by some member of the corps after traveling about 200 ft.

2. Make eight trips around the gallery, passing over the overcast on each trip.

3. Assume that a man in the lecture room is barricaded from afterdamp; apply the ½-hr. apparatus, load him on a stretcher and carry him twice around gallery and to fresh air; unload him and for one minute use artificial respiration, by the prone or Sylvester method.

4. Resume work and build a stopping of rock or brick under the overcast near the farther end of the same.

5. Cut and set up a row of props under the overcast and hang canvas on the props from a point near the stopping to the tunnel. This also may be continued for the length of the tunnel.

6. Take down the stopping, canvas and props, and place where found.

7. In turn make trips around the gallery, pull the weight and crawl through the tunnel, using horn signals during the operation and continue till the 2-hr. period has expired.

SCHEDULE NO. 5

1. Make 10 trips around the gallery as if exploring a mine after an accident, working in team formation by horn signals.

2. In exploring, a fire is found; the captain gives a signal to that effect. Seal off the burning area by a temporary brattice, then by a permanent 12-inch brick wall, the bricks being carried from the extreme end of the gallery on an improvised stretcher. Take down the wall and put the bricks back where they were found. (Not less than 600 bricks shall be used in building the wall.)

3. Form the team in line and examine the gages. Apparatus men Nos. 1, 2 and 3 go through the tunnel, while the others walk once round the gallery, meeting the three men at the end of tunnel. Apparatus men Nos. 4, 5 and 6, now in front of the line, go through the tunnel, while the others go round. Meet as before at the end of the gallery, all the men being in their proper places. Repeat this three times.

4. Carry dummy around gallery and over mine car, changing men each trip as if in relays. Do this four times.

5. Each man saw the ends off two props and pull the weight 25 times.

SCHEDULE NO. 6

Imagine an explosion in the gallery, which, for the purpose, represents a slope mine. The entire mine is filled with dangerous gases. The roof at one end of the overcast is in unsafe condition. All stoppings are blown out. A man is at the far end of the mine from the main entrance near the escapement shaft. The main entrance is that farthest from the overcast. The escapement entrance is full of débris and is inaccessible, and entrance to the mine must be obtained at the main slope, which is the intake. The fan is uninjured. A fire is burning in the mine about halfway inby.

Rescue the man and extinguish the fire, observing as nearly as possible the rules to be observed in case of mine fires and explosions, particularly those relating to work that should be done before entering the mine, the establishment of an inside base, the handling of supplies to that base, the relief of rescue teams at regular intervals and the keeping of accurate records of every event.

The horn signals to which reference is made in these schedules are those used by the Federal Bureau of Mines, given in "Miners' Circular 15, Rules for Mine-Rescue and First-Aid Field Contests," and are as follows:

Number of Blasts	Command Indicated
1	Crew at rest—start to march, captain in lead; maintain 2-yd. intervals.
1	Crew marching—halt.
2	Turn on oxygen and close apparatus.
3	About face.
3-1	Each member examine and read pressure gage, holding gage for inspection by captain, who will record pressure and time of day.
4	Bring forward stretchers, load injured, and lift stretcher preparatory to removal to fresh air.
3-3	Rescue man in distress; all members go to his relief and assist to fresh air; give first-aid treatment.
2-2	Fire discovered; bring fire extinguishers and attack fire.
2-3	Crew retreat toward fresh air.

THE LARGER COAL COMPANIES IN ILLINOIS ALL HAVE APPARATUS

Besides the apparatus and stations of the Illinois Mine-Rescue Station Commission, several coal companies in Illinois have equipped mine-rescue stations of their own, some of them being well equipped. The companies owning oxygen breathing apparatus are:

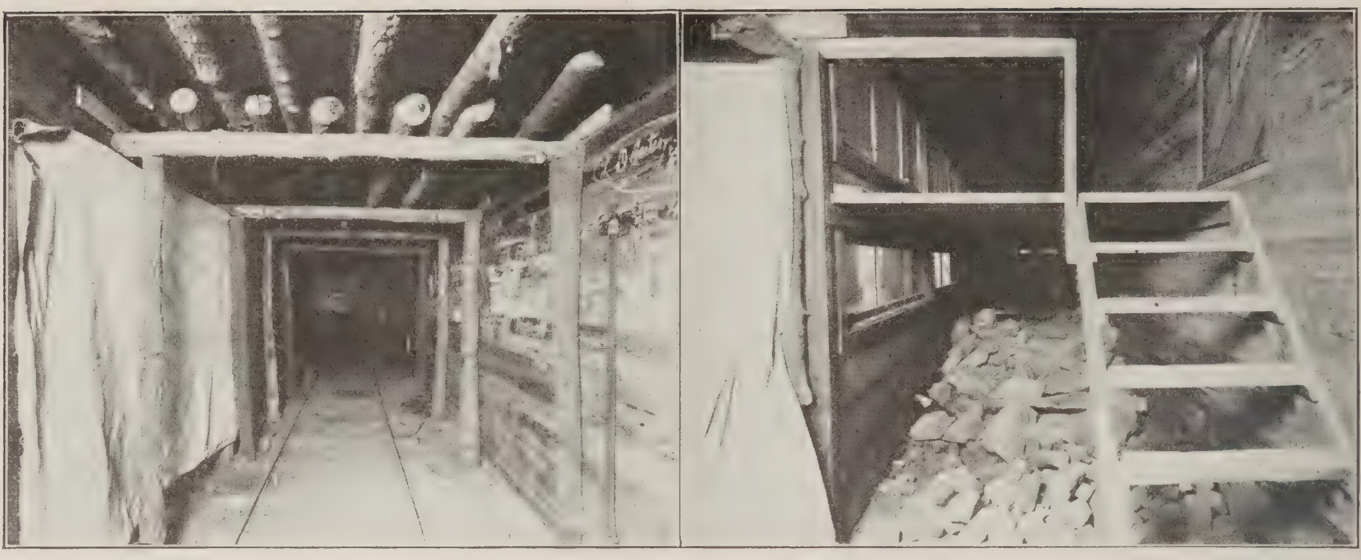
Bell & Zoller Mining Co., Zeigler, 8 sets of Draeger.
Breese-Trenton Coal Co., Breese, 3 sets of Fleuss.
Chicago & Carterville Coal Co., Herrin, 1 set of Fleuss.
Chicago, Wilmington & Franklin Coal Co., 3 sets of Fleuss.
Johnston City Coal Co., Johnston City, 2 sets of Draeger, 1 pulmotor.
Madison Coal Corporation, 18 sets of Fleuss, 6 Salvators.
Mt. Olive & Staunton Coal Co., 3 sets of Draeger self-rescuers.
O'Gara Coal Co., Harrisburg, 2 sets of Draeger, 1 pulmotor.
Saline County Coal Co., Harrisburg, 2 sets of Draeger, 1 pulmotor.
Spring Valley Coal Co., Spring Valley, 4 sets of Fleuss, 5 sets of Westfalia, 1 pulmotor.
Superior Coal Co., Gillespie, 4 sets of Fleuss, 2 sets of Draeger, 1 pulmotor, 6 sets of Draeger self-rescuers.

That there is need for the number of rescue apparatus that there is in Illinois is well set forth by the calls to which men from the different stations responded in 1913-14, as follows:

Mar. 31, 1913, Southern Coal & Mining Co., Oak Hill mine, Belleville. Opened up fire that had been sealed off.

Apr. 9, 1913, Southern Illinois Coal Co., Freeman mine, Herrin. Fire extinguished.

May 24, 1913, Carterville District Coal Co., Marion. Fire controlled. One shotfirer saved, one dead.



LONG SIDE OF TRAINING GALLEY IMAGINARY OVERCAST AND ROCK FALL

VIEWS OF BENTON MINE-RESCUE STATION

June 13, 1913, Dering Coal Co., No. 11 mine, West Frankfort. Opened up fire area that had been sealed off.

June 17, 1913, Lovington Coal Co., Lovington. Opened up fire area that had been sealed off.

Nov. 8, 1913, St. Louis-Coulterville Coal Co., Coulterville. Fire extinguished.

Nov. 14, 1913, Franklin Coal & Coke Co., Royalton. Fire controlled.

Nov. 30, 1913, Franklin Coal & Coke Co., Royalton. Opened up fire area that had been sealed up.

Dec. 14, 1913, Franklin Coal & Coke Co., Royalton. Opened up fire area that had been sealed up.

Feb. 21, 1914, Lake Creek Coal Co., Johnston City. Explosion; two men killed.

June 29, 1914, Lake Creek Coal Co., Johnston City. Fire controlled.

July 21, 1914, Lake Creek Coal Co., Johnston City. Opened up fire area that had been sealed off.

July 24, 1914, Zeigler Coal Co., Zeigler. Fire in escapement shaft; one man killed. Fire extinguished.

Aug. 6, 1914, United Coal Mining Co., Christopher. Fire controlled after 24-hr. work.

Aug. 22, 1914, Dering Coal Co., Mine No. 11, West Frankfort. Explosion; two men and one mule killed. Rescue apparatus of great service in recovering bodies.

Sept. 1, 1914, Joseph Kuskowski, La Salle. Overcome with gas. Revived after 40 min. with pulmotor.

Sept. 2, 1914, Big Muddy Coal & Iron Co., Mine No. 7, Herrin. Fire sealed off.

Oct. 27, 1914, Franklin Coal & Coke Co., Royalton. Mine explosion; 52 men killed. Mine completely explored within 24 hr. and one man rescued.

Dec. 27-29, 1914, Saline County Coal Co., Grayson mine, Eldorado. Mine recovered. Both shafts had been sealed at the surface on account of an underground fire. Men succeeded in confining the fire to the face of two entries by erecting stoppings therein. The fire was over 2500 ft. from the shaft bottom, and breathing apparatus had to be worn from the surface, as the shaft bottom was so arranged that it was impractical to establish a base of operations at that point.

The following men are in charge of the different stations and substations: La Salle station, Alexander Jones and William McMillan; Springfield station, Thomas English and George Smith; Benton station, James Towal and M. J. Carraher; Duquoin substation, Charles Swan and William Cummings; Harrisburg substation, Walter Scott and Walter Nichols; Herrin substation, Thomas Rodgers and James Weir. The members of the commission are Thomas H. Devlin, Assumption, chairman; H. H. Stoek, Urbana, secretary; Fernand Bernard, Westville, assistant secretary; John Slattery, Toluca; Thomas Jeremiah, Willisville; George H. Deemy, Peoria; Joseph A. Holmes, Washington, D. C.

For the guidance of rescue men when they are called upon, the commission has issued the following rules, to be observed in case of fires and explosions:

DUTIES OF RESCUE-STATION SUPERINTENDENT

1. Communicate directly with a responsible officer of the coal company in order to find out the exact nature and extent of the disaster.
2. Notify the Springfield office by telephone or telegraph.
3. Send for emergency men.
4. Arrange for transportation. (a) With railroads, if the car is to go by scheduled train or by special engine. (b) With owners of automobiles or other vehicles, if better time can be made than by rail.
5. Start as soon as possible; read the mine map en route.
6. Upon arrival, confer with the state inspector of mines and the mine officials to learn additional details of the disaster and to decide upon methods of action.
7. Organize rescue squads, which shall consist of not less than 5 men each and which shall advance in the following order: (a) Breathing apparatus or advance squad. (b) Relief squad. (c) Stretcher squad. (d) Temporary ventilation squad. (e) Material squad. (f) More permanent ventilation squad.
8. Establish an "inside station" at a suitable point in the mine to serve as a base of operations for the advance work.
9. Appoint a competent man in charge of the inside station. He should re-examine all safety lamps before they are taken into the interior of the mine; and he should keep records of the details of the rescue work so that complete data may be obtained for studying the efficiency of the men and of the various breathing apparatus.
10. If possible, provide a telephone at the inside station to communicate with the surface, and to be extended into the workings.
11. Allow no person to go in advance of the ventilating current except the breathing-apparatus squad.
12. Maintain a patrol of all doors and brattices leading up to the inside station.
13. Maintain strict discipline at all times.

DUTIES OF THE RESCUE-STATION ASSISTANT

1. Assume entire responsibility for the condition of the breathing apparatus and rescue equipment, both before and during rescue operations.
2. In packing the equipment at the station, check off each item from a previously prepared list, thus guarding against the omission of anything.
3. Test the breathing apparatus as follows: (a) See that each apparatus has a full charge of oxygen and contains a fresh, unused charge of regenerating chemical. (b) The pressure gage should read 120 atmospheres for the Westfalia, Fleuss and 1907-type of Draeger and 150 atmospheres for the 1910 Draeger. (c) If using an injector type of apparatus, connect the water gage to the inhalation and exhalation tubes and ascertain the pressure and vacuum. This should be 3.15 to 3.94 inches (8 to 10 cm.). (d) See that the circulating system, helmet, face-mask or mouthpiece are airtight. (e) Con-

nect the inhalation tube to a measuring bag or gas meter, and ascertain the quantity of air circulating per minute. This should be 1.77 cu.ft. (50 liters). (f) See that all unions are tight. (g) Place the apparatus on a man. (h) Turn on the oxygen. (i) Test the relief valve to be sure it works properly. (j) In some small building, burn sulphur, hay, rags or other pungent material and have each person test his apparatus for possible leaks before entering the mine.

4. After a breathing apparatus has been worn, examine it carefully before permitting anyone to use it again.

5. To guard against the possible use of an untested apparatus, place on each apparatus that you have examined and found in perfect condition, a white tag with the words "examined; ready for use. In case an apparatus is damaged, and cannot at once be repaired, place thereon a red tag with the words "defective; dangerous to use."

6. Always have a pulmotor at the inside station.

7. Arrange a system for relaying oxygen, potash or soda, etc., from the base of supplies on the surface to the inside station.

DUTIES OF THE SPRINGFIELD OFFICE

1. Notify the manager of all the details of the disaster.
2. Instruct the men in charge of the rescue cars to be in readiness for a call.
3. Render promptly any assistance requested by the rescue-station superintendent.

DUTIES OF THE ADVANCE SQUAD

1. Follow the direction of the leader, who is in full charge.
2. Keep close together; do not separate under any condition.
3. Before starting the work, sit down for 5 min. with the apparatus on and in operation. Advance two or three hundred feet and make another stop of at least 3 min. By this means, all in the party will have regained their composure.
4. If one of the party is overcome or injured, the entire squad must immediately conduct him to fresh air.
5. Each member of the squad should hold a rope which leads to fresh air, in order to prevent them from being lost.
6. Mark the location of the dead and living with chalk on the roof and rib, and number the bodies in the order in which they are found.
7. Chalk your way in and out of the mine.
8. Advance to the face of an entry; do not leave any part unexplored.
9. Have a relief squad at the inside station in readiness to assist at a moment's notice.
10. The relief squad should have the apparatus on and ready for instant service. They can leave the mouthpieces open, or the nose clips off; but these should be ready for instant adjustment.
11. Make careful examination for gas, indications of fire, and other dangers.
12. Mark as dangerous unexplored as well as dangerous workings.
13. Do not work with breathing apparatus in a mine at mosphere hotter than 85 deg. F. wet bulb, unless you are within 100 ft. of good air, and then only for a few minutes at a time.

DUTIES OF THE MINE MANAGEMENT

(These duties may be best accomplished by appointing a competent man to assume entire charge of the surface operations.)

1. Maintain strict discipline on the surface.
2. Cut out all electrical currents which enter the mine.
3. Guard all entrances to the mine by establishing safety lines about each opening.
4. Permit no open lights within these safety lines.
5. Take necessary steps to repair any damages to the ventilating or hoisting equipment, and station a reliable man at the fan to make sure that it is in constant operation.
6. Examine all safety lamps before permitting them to be taken underground.
7. Allow only authorized men to enter the mine.
8. Keep a record of the names and time of the men entering and leaving the workings.
9. Arrange for a sufficient supply of nails, ship-lap lumber, brattice-cloth, saws, hammers, axes, etc.
10. Furnish promptly all supplies needed by the rescue squads in the mine.
11. Organize and hold in readiness repair gangs to enter the mine when called for.
12. Appoint men to take charge of each underground shift (except those wearing breathing apparatus).
13. Prepare a list of the missing miners, and arrange for the care of the survivors.
14. Provide food and shelter for those engaged in rescue work.
15. Have a physician on hand.
16. If possible, have a physician at the inside station with necessary supplies for his use.

GENERAL ADVICE

If there is a possibility of saving life, hasten; but be cautious and prudent. Remember that if the life of one of the rescue party is sacrificed, a bad matter is made worse and the resulting delay may make it impossible to reach the entombed men in time to save them.

Remember also that the state inspector of mines and the county mine inspector are not only men of experience, but are vested with state authority to take charge of mining properties in case of disaster. The rescue-station men should, therefore, coöperate heartily with the inspectors in this great work of saving life and property.

The temporary-ventilation squad should not leave gas behind them in side or cross entries, if it can be avoided. Ventilate or brush it out if it is at all possible.

The breathing squads should not begin the first exploration after an explosion by attempting to descend into the mine by means of the escapement stairway. The stairway should always be examined from below and not from above, as there is great danger of the lower portion of the stairway being destroyed by an explosion. A man descending from the top might fall down the stairway on acount of his inability to see the damage that had been done. If he comes to the bottom of the stairway first, he will avoid this.

Do not forget the collapsible cages stored on the rescue cars. If the mine cages are destroyed, or it is necessary to descend by way of the air shaft, these cages may be of great service.

The roof of the mine should be carefully examined by the breathing squad before fires are fought. Water from the hose should never be thrown on the roof if it is possible to avoid doing so. If the roof is of black slate, there is great danger of the water causing the roof to work; for this reason it is safer to timber the roof before starting to fight a fire. A row of props well set is generally sufficient.

Oklahoma First-Aid Meet

By B. E. Clark*

The second annual first-aid contest among the miners of Oklahoma was held at McAlester on Saturday, May 22, under the auspices of the Mine Operators' Association and the United Mine Workers of America. Nine teams from Coalgate, Brewer, Lehigh, Savanna, Dow, Wilburton, School of Mines, Gowen and Krebs participated. There were about 600 spectators. The direction of the meet was under Bureau of Mines officials—Dr. J. J. Rutledge, K. H. Chisholm, J. W. Koster and W. D. Ryan. The men were trained by Messrs. Chisholm, Koster, Young and East, all of the Bureau of Mines.

There were three separate contests—the one-man event, the two-man event and the team event. For the one-man event the first prize was a Koehler safety lamp and a Justrite carbide lamp and first-aid packets. The second prize was a Koehler safety lamp and a Justrite carbide lamp. In the two-man event the first prize was two Wolf safety and two Justrite carbide lamps and first-aid packets. The second prize was three subscriptions to "Coal Age." In the team event the first prize was the silver championship cup, six American Mine Safety Association medals, first-aid packets and a trip to the Kansas City meet provided by the miners' and operators' associations. The second prize was six Justrite lamps and six subscriptions to the "Mine Workers' Journal." The third prize was six Baldwin lamps and six subscriptions to the "Colliery Engineer." The results were:

One-Man Event.—First prize, Krebs, score 100 in five events; second prize, Savanna, score 100 in four events and 92 in last tie, general average 98⅔.

Two-Man Event.—First prize, Krebs, score 100 in two events; second prize, Gowen, score 100 in one event and 94 in tie-off, general average 97.

Team Event.—First prize, Lehigh, score 100 in three events; second prize, Dow, score 97⅔ in three events; third prize, Krebs and School of Mines tied with 97. In breaking the tie Krebs received 100 and School of Mines 90.

---

*Mine engineer, Dow Coal Co., Savanna, Okla.

State-Wide First-Aid Contest in Illinois

By Oscar Cartlidge*

SYNOPSIS—The labor unions in Fulton County, Illinois, all but one, financed this state-wide contest by giving 5c. per member. The operators gave $10 per mine. One local union was represented by a competing team.

The Fulton County First-Aid Association was organized in January of the present year with a large and enthusiastic membership, which immediately began planning ways and means to promote and encourage the first-aid cause in that district of Illinois.

David Z. Thrush, state mine inspector, Farmington, was elected president; John Woods, miner, St. David, secretary; M. S. Coleman, superintendent Big Creek Coal Co., Canton, vice-president; Samuel McKinley, miner, Norris, treasurer.

Shortly after the organization it was decided to hold a first-aid contest on May 1 which should be open to the entire state, and Oscar Cartlidge, chairman, Springfield; James Taylor, Peoria; M. S. Coleman and William Spenny, Canton, were appointed to arrange a program and select the prizes.

A finance committee was named, and the Canton Commercial Club offered $75, agreeing to settle any deficit that might exist after the contest was over. Mr. Woodruff was also active in assisting to carry out the thousand and one details that arise at an affair of this kind.

DUE TO LIBERALITY OF UNIONS AND OPERATORS

Big Muddy Coal & Iron Co. Team, Which Landed the Second Prize

Natty Team of Bunsen Coal Co., Danville, Which Ran Third

Each local union in the county was requested to assess the membership 5c. per capita, and each mine was asked to give $10. It is worthy of note, as indicating the interest in this work in Fulton County, that every mine paid the amount requested and also every local union but one.

The program recorded below was followed to a successful conclusion, even to starting and finishing on time, which is rather unusual:

At 9:30 a.m., parade of first-aid teams and miners, around City Square, headed by the Joe Hooker Martial Band. 10 a.m., address of welcome, by Mayor R. M. Kingsland, of Canton. 10:30 a.m., response by D. Z. Thrush. At 11 a.m., one-man event. First prize: Gold medal for contestant; bronze medal for subject; $10 cash. Second prize: Silver medal for contestant; bronze medal for subject; $5 cash. Third prize: Silver medal for contestant; bronze medal for subject; $2.50 cash. This event to be followed by dinner.

At 1:30 p.m., team event for five or six men. First prize: American Mine Safety Association medals; a silver loving cup and $50 in cash. Second prize: Gold medal for each member of team and $30 in cash. Third prize: Silver medals for each member of the team and $15 in cash.

Event for teams of boys, 16 years old and under. First prize: Junior gold medal for each member. Second prize: Junior silver medal for each member.

The prizes were awarded in the Princess Theater at the close of the contest. The appointed judges of events were: Judge-in-chief, Dr. J. E. Coleman. Judges: Dr. P. S. Scholes, of Canton; Dr. J. C. Simmons, of Norris: Dr. R. G. Richards, of St. David; Dr. Will Plumer, of Farmington; Dr. D. S. Ray, of Cuba. Five others were afterward added so that each of the entering teams had a judge.

At 6:30 p.m., a lecture by W. D. Ryan of the United States Bureau of Mines, at Princess Theater. 7:30 p.m., free moving picture show in the Princess Theater showing mine-safety methods. Reels loaned by the United States Bureau of Mines.

The following discounts were used, being those recommended by the committee of the American Mine Safety Association, which was appointed to regulate first-aid training and contests:

	Per Cent
1. Not doing the most important thing first	6
2. Failure of captain to command properly	1
3. Slowness in work and lack of attention	2
4. Failure to entirely cover wound or ignorance of location of injury	4
5. Ineffective artificial respiration	11
6. Splints improperly padded or applied	6
7. Tight, loose or improperly applied bandages	5
8. Insecure or "granny" knot	4
9. Unclean first-aid material	3
10. Failure to have on hand sufficient and proper material to complete a dressing	3
11. Lack of neatness	2
12. Awkward handling of patient	4
13. Assistance lent by patient	3
14. Tourniquet improperly applied	7
15. Failure to stop bleeding	8
16. Not treating shock	5
17. Failure to be aseptic	7
18. Incorrect treatment	12
19. Failure to temporarily control hemorrhage until tourniquet is applied	7
	100

Samuel Pascoe, miner, of Farmington, was named officer of the day and was delegated to present all prizes, except the medals of the American Mine Safety Association, which were presented by the writer.

The teams entered were as follows:

1. Local Union No. 860, St. David, Ill.; W. Thomas, captain. 2. Big Creek Coal Co., St. David, Ill.; K. Hogan, captain. 3. Big Muddy Coal & Iron Co., Herrin, Ill.; B. Milam, captain. 4. Cuba team, Cuba, Ill.; J. Cooper, captain. 5. Brewster & Evans Coal Co., Peoria, Ill.; T. Trigg, captain. 6. LaSalle Mine Rescue Station, LaSalle, Ill.; W. Kemery, captain. 7. Bunsen Coal Co., Danville, Ill.; J. Krainock, captain. 8. Farmington team, Farmington, Ill.; W. Craine, captain. 9. Gillespie First-Aid Association, Gillespie, Ill.; G. Mauchlin, captain. 10. Gillespie team No. 1, Gillespie, Ill.; J. Struthers, captain. 11. Dewmaine team, Dewmaine, Ill.; E. Russell, captain.

Following are the junior teams: Farmington team, Farmington, Ill.; H. Steel, captain. St. David team, St. David, Ill.; L. Canfield, captain.

Three problems were given in the team event, and the average rating received determined the standing of the team, the judges changing places each time. The problems were handed to the team captains in sealed envelopes and they were allowed 5 min. in which to read them over.

Problem No. 1.—Compound fracture of left thigh with profuse arterial bleeding; compound fracture of right forearm; cut from outer corner of right eye to top of right ear with bleeding. Time 10 min.

---

*Manager, Illinois Mine-Rescue Stations, 1363 Whittier Ave., Springfield, Ill.

Problem No. 2—Fracture of pelvis, left side. Fracture of sixth, seventh and eighth ribs, right side. Fracture of left elbow. Fracture in right shoulder joint. Deep laceration of calf of leg, right side, with profuse venous hemorrhage. Deep scalp wound with hemorrhage from right outer corner of eye to above right ear. Time 18 min.

SUPERIOR NO. 1 TEAM, WINNERS OF FIRST PRIZE
From left to right, in rear, Oscar Cartlidge, W. D. Ryan and James Boston

Problem No. 3—Powder keg exploded, burning miner severely on face, neck, chest, right arm and both hands. Carry 50 ft. on improvised stretcher and treat. Time 12 min.

The standing of the teams at the conclusion of the event follows:

Team	Ratings			
	Event 1	Event 2	Event 3	Average for Events
1—Union 860	99	84	98	93⅔
2—Big Creek Coal Co.	100	88	100	96
3—Big Muddy Coal Co.	100	100	94	98
4—Cuba	100	92	96	96
5—B. & E. Coal Co.	85	81	97	87⅔
6—La Salle Rescue Sta.	95	91	93	93
7—Bunsen Coal Co.	97	100	94	97⅓
8—Farmington	90	78	96	88
9—Gillespie F.-A. Assoc.	98	82	98	91⅓
10—Gillespie No. 1	98	99	98	98⅓
11—Dewmaine	87	76	95	86

This gave first place to the Superior Coal Co. No. 1, of Gillespie; second place to the Big Muddy Coal & Iron Co., of Herrin; third to the Bunsen Coal Co., of Danville.

The Bunsen and Gillespie teams have competed in many events, and neither team has ever failed to be among the prize winners. The former team is the present champion of the United States, having won that honor at the Terre Haute meet last year.

BEST TEAM OF JUNIORS, A ST. DAVID ORGANIZATION

Nos. 2 and 4 having tied for the highest score made by a Fulton County team, with 96 each, the captains drew lots to see which should get a Johnston & Johnston first-aid cabinet presented by B. Greenwell, with the result that it went to No. 4, the Cuba team.

Two teams entered the junior event, and the boys did creditable work, attracting fully as much attention as the regular teams. The first prize went to St. David and the second to Farmington.

Forty-two men entered for the single event, the problem being:

One man event: Miner overcome by gas in 3-ft. seam; simple fracture of right arm; remove 20 ft. and treat.

Six tied for the first place and so the following problem was given:

Fracture of left knee cap; severe scalp laceration back of right ear. The result was that James McKenna, Big Creek Coal Co. No. 2, was declared winner of first prize; Robert Weir, Superior Coal Co., Gillespie, second; Charles Miller, Superior Coal Co., Gillespie, third.

The four reels of pictures loaned by the Bureau of Mines were greatly enjoyed by a crowded house, as was the address by W. D. Ryan. He was formerly secretary and treasurer of the Illinois United Mine Workers' organization and hence has a large acquaintance in Fulton County.

W. W. Fleming, a Bureau of Mines first-aid worker, on my invitation, was sent to assist in promoting the contest, and spent about 30 days in the county. Much of the success of the meet, which was pronounced by several competent persons the best ever held in the state, was due to his effort and that of the president, D. Z. Thrush. To them, the miners' and operators' committees, and the Canton Commercial Club too much praise cannot be accorded.

Miners Own Homes and Automobiles

In these days when the high cost of living makes the average tradesman or laborer hustle for a living for himself and family, and real luxuries are not considered, it is interesting to note that in a mining town in the New River field of West Virginia there are several coal miners who own automobiles, and good ones, too, and get as much pleasure out of them as the capitalist in his six-cylinder. The fact that they have been able to buy them is not surprising, for when conditions are normal they can make more money digging coal than could be earned by many college graduates, who could not dream of the luxury of an automobile.

And in this same town are a number of coal miners who own their own homes—men who have worked for good wages where living is not excessively high, and are the proud possessors of comfortable homes for their families.

And a visit to the bank in this same town, where all the residents make their living directly or indirectly from the mines, disclosed the fact that there were at least 400 industrial depositors in the savings department, one Italian miner heading the list with $3000 to his credit, and many others with accounts running into four figures. A number of these men could buy automobiles if they wanted them. On the street a husky colored miner was asked to tell the most he had ever made in one month in the mines, and his reply was $327.82, out of which he paid his helper at the rate of $2.50 a day. The truth of this statement was vouched for by the mine manager.

These facts give weight to the claim that of all classes of workmen the West Virginia coal miner has the best opportunity to earn good wages, and save if he wants to.

* * *

Misdealing by Coal Company's Representative—Where bills of lading covering shipments of coal came into the rightful possession of a fuel company, and its representative, claiming to own the coal individually, sold it to plaintiff and procured substituted bills of lading in favor of the latter, appropriating the proceeds to his own use, plaintiff remained liable to the fuel company for the value of the coal, although innocently reliant upon the representative's misstatements, where an examination of the substituted bills of lading would have put plaintiff on inquiry as to the representative's right to deal with the coal as his own, since they showed that the substitution was made at the request of the fuel company. (Colorado Court of Appeals, Rocky Mountain Fuel Co. vs. George N. Sparling Coal Co., 143 Pacific Reporter 815.)

Discussion By Readers

The Miner and Safety

Letter No. 2—Referring to the letter of James T. Reynolds, Coal Age, May 15, p. 861, permit me to say that I have frequently heard experienced miners make remarks similar to those recited by Mr. Reynolds. I have also heard experienced miners who are sensible in other respects and who ought to have known better, upon their attention being called to the danger of certain things that they are doing, reply, "Oh, I have been doing that for 20 years and never been hurt yet," or make some such foolish remark.

Now, when the mine superintendent or foreman is given such a reply to his well-meaning remonstrances, I believe much good can be accomplished if he will then and there sit down and have a heart-to-heart talk with the man and try to convince him of the folly of his way, and point out to him that, even though he has been indulging in such dangerous practices for a number of years without being hurt, it is within the range of possibility that he may be the very next one to be injured as a result of the risk he takes so willingly.

A foreman will always be able to recall instances where men have been injured and perhaps killed by practices that they had always considered harmless. In remonstrating with miners along this line, it is well for the foreman to mention one or more of these particular cases and strive to drive the lesson home in a way that will be effectual in stopping the practice. The miner should be made to feel that it is more good luck than good management on his part that he has escaped thus far.

I believe much good can also be done, in this respect, by occasionally getting as many of the men as possible together and giving them a talk on safety; or, better still, get somebody else to do the talking. Many large coal companies are doing this and illustrating the talks with lantern slides, which always impress the men more vividly than a simple unaided talk. This can be done very conveniently in connection with "first-aid" meetings.

Longwall in Pittsburgh Seam

Letter No. 10—In reading a recent issue of Coal Age my attention was drawn particularly to the longwall-retreating plan proposed by John Oldroyd for working the No. 8 seam in Ohio. This proposed plan is described in Letter No. 7, May 15, p. 859.

I am an old coal miner, my first experience in longwall work having been gained at Bagillt, North Wales, in 1867, when I was employed as "drawer" in a mine worked on the longwall-advancing system. Since that time, I have worked in mines in several counties in England and Wales, as well as in several of the states. My mining experience in this country began at Pocahontas, Va., 1885.

This experience has made me familiar with almost every method employed in the mining of coal, and I have taken great interest in studying these different methods closely. I cannot say that I have ever yet seen a mine worked on the longwall-retreating plan that proved successful from an economical standpoint. On the other hand, the longwall-advancing system has many advantages. As mine manager for the Oglesby Coal Co.'s mine at Oglesby, Ill., for over eight years, I had a good opportunity of judging of the practical benefit derived in mining coal on this system.

Since 1900 I have changed the plan of working a mine in Iowa from the room-and-pillar system to the longwall-advancing system, the change proving successful in every respect. More recently, I opened a drift mine on the outcrop in this state, and although I had the longwall-retreating system on the brain at that time, having studied it carefully, I did not venture to adopt it in the development of the mine. I may say that I have long since given up the idea that the retreating plan of longwall can be applied as economically or I might even say as safely as the longwall-advancing system. I shall be glad to hear from anyone who has made a success of that method of mining coal for a period of, say, five years.

I was much pleased with G. R. Waddell's letter No. 6, Coal Age, Apr. 24, p. 732. His letter has the clink of a true longwall man. I fully agree with Mr. Waddell that the No. 8 seam in Ohio can be worked successfully on the longwall-advancing plan. I would say, however, that an expert longwall boss will be required and a few good longwall miners to start the work successfully.

Sparta, Ill.

⁂

Rotary Converter vs. Motor-Generator Set

I was much interested in the article by Thomas Robson Hay, entitled "Rotary Transforming Equipment for Coal-Mining Work," Coal Age, May 22, p. 880, and I desire to offer a few comments bearing on the choice between the rotary converter type of machine and the motor-generator described so fully in the article.

High-tension lines now traverse industrial sections and coal fields and sell their energy for the mechanical operation of mines and factories. The adoption of machinery for utilizing and converting this power into the desired or prescribed voltage for mine service is of the first and greatest importance to the purchaser of electric power.

The article in question is especially favorable and partial to the synchronous motor-generator set. However, the 25-cycle rotary converter has been used for years in general and severe railroad work and has stood the test of time. Rotary converters are used exclusively by the Berwind-White Coal Mining Co. and the Pennsylvania Coal & Coke Co. and very largely by the Consolidated Coal Co. and the H. C. Frick Coal & Coke Co.

These companies maintain underground and surface substations equipped with this type of machinery. It would therefore seem that Mr. Hay's article apparently places the rotary converter on trial; and for the benefit of those mine operators and officials who are using electric power from high-tension lines, it is up to the manufacturer and the master mechanic to seriously scan and analyze the advantages here claimed for the synchronous motor-generator set.

The rotary converter is not an intricate machine. Practically all the adjustments possible on the motor-generator set are possible on the rotary converter. The strongest difference is that the rotary converter delivers 275 volts flat. The service companies are now prohibiting the installation of induction motors on account of their large current drafts. The mechanic having charge of mine machinery is quite as capable as the mechanic in other industries, and the attendant is usually as desirous of acquiring technical information. The old custom of mine operators buying machinery that will not "rip, wear or tear" and overlooking the points of efficiency and economy is a thing of the past. At any rate the rotary is fast coming into use for mine service and the discussion of the advantages and disadvantages of these types of machines mentioned is abreast of the time.

⁂

Labor in Mining

Letter No. 2—Referring to the query that appeared on the editorial page of Coal Age, May 22, p. 896, asking why it is necessary for the coal industry to be always in a strike turmoil, permit me to say that in my opinion there are two general causes for the existence of this condition: 1. The activities of the labor agitator and radical labor leaders. 2. The unfairness of certain employers of labor and the consequent injustice that is often done the miner.

The first of these two causes needs no explanation, and I can offer no suggestion as to the best means to be adopted to rid the coal-mining industry of the evil effects of the work accomplished by these unwelcome parasites. It seems almost a foregone conclusion that the labor agitator and the radical labor leader are necessary adjuncts of coal mining, and those familiar with mining operations are too well acquainted with their methods and work to need further explanations.

In regard to the second cause mentioned, however, there is much room for suggestion and improvement. I refer, here, to the unwise and thoughtless disposition on the part of many employers of labor to treat their employees with manifest unfairness, completely ignoring or giving slight attention to their complaints and frequently compelling them to work under conditions that are unhealthful, dangerous and unnecessarily arduous.

My reference to the unfairness of many employers includes all mine officials in authority, both underground and on the surface, who are prone to treat their employees with little consideration and who frequently try to take advantage of them and keep them in ignorance, many times, of conditions that interest them and concern their welfare. Such employers, on being approached by workmen with a just complaint or grievance, refuse to listen to them at all or perhaps put them off with a promise that they have no intention of fulfilling.

When men are treated like *machines* instead of human beings it creates a spirit of unrest and dissatisfaction that, to the agitator, is half the battle. The trouble from this source can be wholly prevented if employers will deal with their men with absolutely fairness and justice. In that way only can they expect to keep the respect, confidence and loyalty of their employees. Employers must manifest a personal interest in the welfare of both their men and their families, safeguard the men at work, provide comfortable and sanitary houses, garden spots, playgrounds and other amusements, as well as schools, churches, hospitals and first-aid training and educational classes. These things all tend to make better and more contented employees.

Labor is as important to capital as capital is to labor. *Both are entitled to fair treatment and equal consideration.* Neither can prosper without the other. An employer cannot expect his men to be fair, honest and considerate of his interests unless he manifests the same interest and disposition toward them. In times of prosperity, when coal brings high prices, labor should be given a proportionate increase in daily wages or made to share proportionately in the prosperity. This is just as true as the fact more readily accepted that a decrease in wages is necessary during a business depression, when coal brings low prices in the market.

In closing, I may be permitted to refer briefly to a third condition or class of people whose baneful influence in promoting discord among workers often escapes notice because of their position and the trust imposed in them. I refer, here, to the disloyal official who has his eye on the job of someone higher up and who strives by underhand methods to stir up discontent among the men, hoping thereby to discredit the one whose position he covets. The tin-can remedy should be applied in such a case as soon as the party is discovered; in other words, he should be promptly "canned."

Edw. H. Coxe.

Knoxville, Tenn.

Letter No. 3—The request is made on the editorial page of Coal Age, May 22, p. 896, that someone enlighten Mr. Le Baron, who asks, "Why is it necessary for the coal industry to be always in a strike turmoil?"

This is an easy question to answer when one gives it careful consideration. I used to ask myself the same question until later when I discovered its solution. The mining industry is communistic, in the sense that its workers form a community in themselves. Their relation to each other and their mutual dependence are almost as close as is the case with the crew of a ship. They live together as a great family.

The ordinary mining town of today is composed of, say, 200 houses, nearly all being built alike and possessing no distinctive characteristics save the number of the house. The lots are of the same size, the houses of the same color and all rent for the same amount. A host of other details are likewise the same for each family. As a result, they think the same thoughts and act on the same principles. I say this condition is peculiar to mining as the industry is conducted in this country today.

In the ordinary mining camp today there is little if any social life except among neighbors whose household details are the same in every respect. The fashion of the clothes worn by men and women is the same and often strikingly different from that of the outside world. The family income, with few exceptions, is practically the same and the expenses the same. In fact, every detail of life, school, provisions, medical care, etc., is the same for each family so far as the rank and file of the mining town is concerned.

Now, keeping this idea of the sameness of community life in mind, is it any wonder that it becomes an easy matter to stir up trouble among workers who touch elbows so closely that a grievance of one, however slight, becomes a common grievance, recognized and supported by all. It matters not how small or insignificant the complaint may be if it is only strongly asserted and repeated. The community come to feel and act as one. Its members will work together for a long time in peace, with an undercurrent of good-will, and for the most part an ideal of good work, good pay, good health and enjoyment is plainly manifest. Under these conditions there is a general feeling of satisfaction that pervades the entire place.

Assume, however, that something goes wrong and note the suddenness of the change that follows. Ideals of peace, good work, good pay, good health and enjoyment are exchanged for ideals of distrust, enmity and war. The issue is now one of labor against capital, growing out of an assumed or common belief that capital is against labor. The feeling is, as of old, "'Our handicraft is in danger'—the means of our support is menaced," and the common thought among the workers is, Labor must win; Capital must yield. In every mining camp or village there is the same community life whether union labor or nonunion labor is employed. The word "scab" has become a social weapon and is hurled with terrible force and effect against one who essays to stand out or separate himself from the community of workers.

To illustrate the strength of this social weapon, suppose a big man came into your office and demanded that you throw off your linen collar and your $1.50 necktie and not wear them again. You wear these items of dress because a hundred other fellows do the same. You picture yourself coming downtown in a collar button without collar or tie, and reply that you will quit your job before you will part with these necessities of dress. They are good things that any self-respecting man will refuse to lay aside because requested to do so by another who hails from a Patagonian tribe and is noted for his hatred of clothes, collars and ties, but adores a dress of untanned cowhide as does every self-respecting Patagonian.

When one considers, therefore, that corporate handling of labor is often productive of trouble when least suspected, unless careful consideration is given to avoid these pitfalls, there need be no marvel that strikes occur as often as they do. The marvel is rather that they are not more frequent and that we live and work together in comparative harmony in most mining districts and produce the coal that warms and energizes the world.

N. D. MONSARRAT.

Columbus, Ohio.

Letter No. 4—The recent reference to this subject in COAL AGE leads me to make a few comments on what I believe is a most serious feature of the labor problem and one that is likely to confront the mining interests in the United States, especially those of West Virginia, when the European war is ended. From its importance to the coal industry, this problem demands attention.

Having spent my boyhood days in the old country, I am familiar with labor conditions there as well as here in the United States. It is obvious to even the casual observer that the main reason foreign labor emigrates to this country is because of the better wages paid for the same work. The majority of these people, however, expect to accumulate enough money from their savings to enable them to return to their old home in a few years and live in what they consider comfort the rest of their days. Many and probably the majority of the foreign laborers employed here in coal mining never learn the English language to speak it fluently, and as a result they do not become acquainted with American ways and customs.

The question for us to consider in this connection is what is likely to take place when the war is over. Will there be an influx or an exodus of labor in this country? In my opinion, the exodus will largely overbalance the influx. It may be argued that taxation in Europe will be very high at the close of the war—so high as to be burdensome; but, even so, it must be allowed that such taxation will be adjusted among different classes of taxpayers, the laborer bearing the smallest part. At the present day, the German government is paying to unskilled laborers wages that are 100 per cent. higher than were paid to the average German laborer four years ago. In Great Britain demands for increased wages are now being made and this will undoubtedly be repeated in other European countries.

As a result of the war, there will be an extraordinary demand for labor, not only to go into the mines, but to rebuild cities, cultivate land and, in fact, work along every line of industry. If the question is asked, How will the money be raised to pay for such work? it is only necessary to recall the rapid rebuilding of San Francisco, following its destruction by earthquake and fire in 1906, and observe how readily the capital was advanced for rehabilitating that devastated area in a miraculously short time. There is little doubt that the same experience will be repeated in Europe at the close of the war. Reconstruction will then take place on a much larger scale; competition will be severe not only in coal mining but in other industries as well.

Under these conditions, strong family ties will draw a large portion of our foreign labor back to their European homes where fathers, mothers, brothers, sisters and children are left alone without support. Such will be the demand for labor that government examinations and requirements will be less rigid in all lines of work and men holding minor positions in this country will be able to secure far better paying positions at home.

In addition to all this, mining is becoming more difficult each year and the foreign miner finds it hard to make his way without being taught at least some English and becoming familiar with the ways of this country. The question presented for solution is how to prevent most effectively such an exodus of foreign labor from this country as may be expected to take place.

On various occasions I have urged that what may be called "Continuation Schools" should be established by the state, offering free instruction, particularly to miners on mining subjects and to foreigners, teaching them to speak and read the English language. Trained teachers capable of giving instruction in scientific and practical subjects could be employed. Or, a system similar to what is known as the "Walking Schools of Norway" might be well adopted in this country. The plan is worthy of careful consideration by all interested in the labor problem.

This plan may be briefly described as follows: A man of broad scholarship, great aptness as a teacher and possessing particular fitness to win the sympathy and confidence of the working classes goes to a mining community, secures the largest room in the place and establishes a school for the miners. He remains in this place several weeks, assigning and hearing lessons, designating books that must be read and outlining work for future study. He then passes on to another town where he starts the same work in a similar manner. The teacher is selected and paid by the government, which furnishes the general material required in the school work, including all necessary books and papers for the students, besides providing and heating and lighting the rooms for holding the classes.

This plan could be modified in this country to the extent that the regular teacher, in his judgment, could appoint from among the older and better qualified students one to take charge in his absence, designating the time when he would return to the place. In this manner, one regular teacher could supervise the work in, say 10 or 12 different places, staying about two weeks or more in each place and returning two or three times during the year.

In closing, I thought it would be of interest to present the following figures showing the immigration into this country during the fiscal year of 1914. Out of a total number of 1,218,480 immigrants, there were 226,407 belonging to the laboring class. The distribution of this foreign immigration in several of our leading mining states for the same year was: Pennsylvania, 184,438; Illinois, 105,811; Ohio, 74,615; West Virginia, 12,399.

It is a matter of some significance in this state that Pennsylvania received more than 14 times the number of immigrants that reached West Virginia, and Illinois more than eight times the same number, while Ohio received more than six times that number. These figures seem to indicate that West Virginia is sadly neglecting her labor problem. Had the distribution between these states been in proportion to the output of coal, the figures would practically have been: Pennsylvania, 230,000; West Virginia, 60,000; Illinois, 57,000: Ohio, 30,000.

This is a matter that should receive the attention of all West Virginia coal operators. It is to be hoped that mining men in this state will realize the gravity of the labor problem in this country and especially in our own state and adopt some remedial measures before the question becomes a serious menace to the coal-mining industry.

Study Course in Coal Mining

By J. T. BEARD

The Coal Age Pocket Book

Chemical Change, Reaction—Any interchange of atoms between two substances, or a combination of two unlike substances, by which one or more new substances are formed, is a chemical change and the process is called a "chemical reaction."

A Chemical Equation—It is a natural law that no matter is ever lost or destroyed. **Matter is indestructible.** As a result of chemical change both the form and nature of the matter may be altered—a solid may become a liquid or gas, or vice versa; but the weight of the resulting products is the same as that of the original substances that are involved in the reaction.

Since there is **no change** in the weight of matter before and after chemical reaction takes place, it is possible to express the reaction by an equation showing the equality of matter. This is called a **chemical equation.** It is formed by writing in the first member the chemical symbols of all the substances entering or involved in the reaction, connecting these together with a plus (+) sign. Likewise, in the second member of the equation, write the chemical symbols of the several products of the reaction, connecting them together, as before, with a plus (+) sign. Then complete the equation by writing the sign (=) of equality between the two members.

For reasons that will be better understood when discussing molecular volume, when writing a chemical equation each substance should be expressed by its molecular formula. This means that any elementary or simple substance as carbon (C), hydrogen (H), nitrogen (N), etc., should be expressed as a molecule; thus, C_2, H_2, N_2, etc.

Illustration—When carbon (C) is completely burned in a plentiful supply of oxygen (O) there is produced carbon dioxide (CO_2). The reaction is expressed by the equation

$$C_2 + 2O_2 = 2CO_2$$

The expression $2CO_2$ should be interpreted to mean two molecules of CO_2, each comprising one atom of carbon and two atoms of oxygen.

Observe there are the same number of atoms of carbon and the same number of oxygen on each side of the equation. **Not an atom is lost** in the reaction, although these are grouped differently. In this case the solid carbon unites with the oxygen (gas) and carbon dioxide (gas) is produced. Also, the weight of the carbon dioxide is equal to the sum of the weights of the carbon burned and the oxygen consumed. There is **no loss in weight.**

It is important to note that the **atoms** involved in any reaction represent the **weights** of the substances they form, while the **molecules** or molecular formulas of the several substances represent their respective **volumes.** Hence, when each substance is expressed by its molecular formula the chemical equation shows both the **relative weights** of all the substances and the **relative volumes** of the gases.

In the reaction represented by the above equation each atom of the carbon molecule (C_2) takes up two atoms of oxygen to form the molecule of carbon dioxide (CO_2), the valence of carbon being four and that of oxygen two. The reaction in this case is complete, the affinity of the carbon for oxygen being fully satisfied.

The Coal Age Pocket Book

Use of Chemical Equations—As previously stated, when properly written a chemical equation shows both the relative weights and relative gaseous volumes of each respective substance involved in a chemical reaction. The relative weights are indicated by the molecular weights of the substances as shown by the completed equation.

In estimating relative gaseous volumes, **the volume of a gaseous atom is taken as unity** and since, as previously explained, an elementary molecule is assumed to contain two atoms and all gaseous molecules at the same temperature and pressure are of equal size regardless of the number of atoms they contain, it follows that **the relative volume of all gaseous molecules is two.**

Application of the Law of Volumes—The law of molecular volume as just explained finds important application in calculating the volumes of gases that are involved in a chemical reaction. While there is never any change in the weight or amount of matter due to chemical reaction, there frequently results a **change in the volume** of the gases concerned in the reaction.

To illustrate such change of gaseous volume with the chemical equation representing the dissociation of ammonia gas (NH_3) by electrolysis, forming free nitrogen (N) and hydrogen (H) gases, placing below each molecular formula its relative or molecular volume; thus,

$$\begin{array}{lccccc} & 2NH_3 & = & N_2 & + & 3H_2 \\ \text{Mol. vol. ....} & 2 & & 1 & & 3 \end{array}$$

It is evident that two molecules of ammonia gas, in dissociation, yield one molecule of nitrogen and three molecules of hydrogen, making four volumes in all. In other words, two volumes become four. The volume of the gases resulting from the breaking up of the molecule of ammonia is double that of the original gas.

There is no chemical change of volume when methane or marsh gas (CH_4) is exploded in a plentiful supply of normal air, and the methane is completely burned, forming only carbon dioxide (CO_2) and water (H_2O). The nitrogen of the air being unchanged it may be omitted in writing the equation expressing this reaction, which is as follows:

$$\begin{array}{lccccccc} & CH_4 & + & 2O_2 & = & CO_2 & + & 2H_2O \\ \text{Mol. vol. ....} & 1 & & 2 & & 1 & & 2 \end{array}$$

The equation shows that the complete combustion of methane requires twice its volume of oxygen; and there is produced an equal volume of carbon dioxide and two volumes of aqueous vapor.

On the other hand, when carbon monoxide (CO) is burned in air, producing carbon dioxide (CO_2), there results a reduction in volume, as shown by the following equation:

$$\begin{array}{lccccccccc} & 2CO & + & O_2 & + & 4N_2 & = & 2CO_2 & + & 4N_2 \\ \text{Mol. Vol. ....} & 2 & & 1 & & 4 & & 2 & & 4 \end{array}$$

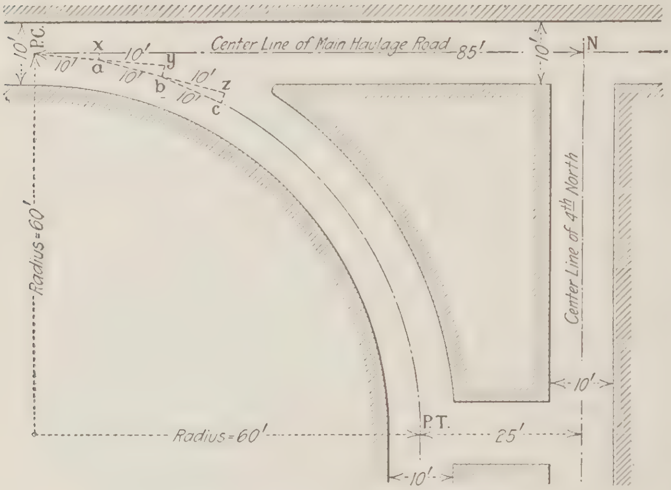
Normal air consists of practically one-fifth oxygen and four-fifths nitrogen. The equation shows that two volumes of carbon monoxide, in burning, consume five volumes of air, and there remain two volumes of carbon dioxide and four volumes of unchanged nitrogen. The seven volumes of the original gas and air are thus reduced to six volumes of burned gases.

Inquiries of General Interest

Laying in a Mine-Track Curve

I have had considerable trouble in laying track curves in our mines so that they will present a uniform curvature and meet the cross-entry at the proper point and tangent to its center line. Suppose, for example, the distance from the second-north to the fourth-north entry is 1200 ft., and I want to cut off the third-north to form a "blind" entry, by a curve extending from a certain point on the main-haulage road outby from the fourth-north and meeting the third-north at a point where the curve will be tangent to the center line of that entry and provide an entry pillar 15 ft. thick. All the entries are 10 ft. wide, which makes the distance, center to center, between the entries 25 ft.

The radius of the curve is to be 60 ft., and I want to find how far back from the center line of the fourth-north I must start the curve to meet the third-north as described. The north-entries are turned off at right angles to the main-haulage road.



Showing Cut-off to Blind Entry

OSTEL BULLOCK.

Cleaton, Ky.

Since the fourth-north entry is turned at right angles to the main-haulage road, the distance from the intersection of the center lines of these entries at *N*, in the accompanying figure, to the point of curve (*P.C.*) is equal to the radius of the curve plus the distance between the center lines of the two north entries, or 60 + 25 = 85 ft.

To lay out the curve, start from the P.C. point and measure a distance of 10 ft. to a point *a* on the curve, making the tangent deflection *ax* = 10 in. This tangent deflection is calculated by the formula

$$ax = \frac{c^2}{2R} = \frac{10^2}{2 \times 60} = \frac{100}{120} = 0.83 \; ft. \; or \; 10 \; in.$$

The distance *ax* is measured perpendicular to the center line of the main road, while the 10-ft. chord is measured along the curve.

Now measure another chord *ab* = 10 ft. and extend the previous chord, making *ay* = 10 ft. The distance *by* is a chord deflection, and its length is twice that of the tangent deflection *ax*, or 20 in. In the same manner extend the chord *ab*, making *bz* = 10 ft., and measure another chord *bc* of 10 ft., making the second chord deflection *cz* equal to 20 in. Great care is needed in extending each chord in order that the curve shall be tangent to the center line of the third-north at the P.T. point.

Theoretical Velocity Due to Water Gage

Some time since I remember seeing a formula given in COAL AGE for finding the theoretical velocity of air due to a given water gage. The formula was based on 1 in. of water gage as being equivalent to 68 ft. of air column. The formula given was

$$v = 8 \sqrt{68 \; w.g.}$$

A formula that is much used by fan engineers for obtaining the theoretical water gage (w.g.) due to a given peripheral velocity (*v*) of the fan, as expressed in feet per second, is

$$w.g. = \frac{v^2 \times 0.078}{32.16 \times 5.2}$$

I would much appreciate an explanation of the difference in these two formulas.

VENTILATING ENGINEER.

Wilkes-Barre, Penn.

The formula first quoted expresses the theoretical velocity (*v*) of free air, under a water gage (*w.g.*). This velocity is expressed in feet per second and the water gage in inches, as explained in COAL AGE, Vol. 5, p. 219. The formula is developed from the well-known basal formula

$$v^2 = 2gh \text{ or } v = 8\sqrt{h}$$

The second formula, quoted by correspondent as used by fan engineers, expresses more or less closely (depending on the conditions affecting the circulation of the air current) the water gage in inches, due to the peripheral speed of the fan in feet per second. This formula is the result of the experiments of M. Murgue, a French engineer who laid down the rule that "The theoretical depression or water gage due to the speed of the periphery is, in a perfect fan, equal to twice the height of column necessary to generate such velocity in a falling body."*

This rule makes the head, pressure, or water gage due to a given peripheral speed of a centrifugal fan equal to twice the head necessary to generate that velocity in a falling body. The two formulas have a different application and should not be confounded. The difference in their use is similar to the difference between the *stored energy* of a moving body as expressed by $mv^2/2$ and the force of impact as expressed by mv^2, which force of impact is double the stored or kinetic energy.

---

*D. Murgue's "Theories and Practice of Centrifugal Ventilating Machines," p. v.

Examination Questions

Pennsylvania Anthracite Mine Inspectors' Examination, Held at Wilkes-Barre, Apr. 20-22, 1915

(*Selected Questions*)

Ques.—Briefly explain, in a general way, your knowledge of electricity and its usage in coal mines. What are the usual voltages employed in mines?

Ans.—In respect to its use in coal mining, electricity furnishes a means of transmitting power from a power plant on the surface, where the electric current is generated, to the innermost point of the mine workings, where it is applied for driving coal-cutting machines and drills and frequently employed for the purposes of lighting the mine and blasting the coal. The electric current is conveyed through electrical wire conductors that are installed in the mine passageways. The flow of electricity is similar to that of air or water, the *voltage* corresponding to the pressure, the *strength of current* or amount of current to the quantity of the flow and the *wattage* to the power transmitted.

In the use of the direct current for haulage, coal-cutting, drilling, etc., the common voltages employed in coal mining are 250 and 500 volts. In the use of an alternating current for transmitting power considerable distances, the common voltages employed are 110, 220 and 440 volts. The voltage at the generator is generally 20 or 25 volts higher, in each case, to allow for the necessary drop in transmitting the current from the generator or power plant on the surface to the working face in the mine where the power is to be used.

Ques.—A colliery operated by a slope 2263 ft. long, on a pitch of 45 deg., makes a maximum of 100,000,000 gal. and a minimum of 30,000,000 gal. of water per month; describe the pumping plant required, using simple direct-acting pumps. Assume 80-lb. steam pressure at the pumps and make the necessary calculations.

Ans.—It is necessary to estimate on the maximum flow of water, since otherwise the sump would be overflowed during the wet season. A flow of 100,000,000 gal. of water per month is 100,000,000 ÷ (30 × 24 × 60) = 2315 gal. per min. It will be safe, therefore, to base the estimate on a maximum flow of, say, 2400 gal. per min.

The size of column pipe required for this discharge is

$$d_c = 0.25\sqrt{2400} = 12.2,\ \textit{say}\ 12\ \textit{in.}$$

On a pitch of 45 deg., the head corresponding to a distance of 2263 ft. is 2263 × sin 45° = 2263 × 0.707 = 1600 ft. To this head must be added the friction head due to a flow of 2400 gal. per min. in a 12-in. pipe, say 2300 ft. long. The friction head is

$$h_f = \frac{2300 \times 2400^2}{800 \times 12^5} = 66+\ \textit{ft.}$$

For this size of column pipe the velocity head could be ignored as it is less than 1 ft. The total effective head under which the pump must operate is therefore 1600 + 66 = 1666 ft., to which must be added a few feet to allow for draining the sump and for discharging at the surface. It will be well, therefore, to estimate on a total effective head of, say 1700 ft.

Using a simple duplex double-acting pump, each cylinder must handle 2400 ÷ 2 = 1200 gal. of water per min., and assuming a piston speed of 100 ft. per min. for this pump, the diameter of the water-end is

$$d = 5.37\sqrt{\frac{1200}{100}} = 18.6\ \textit{in.}$$

For a steam pressure of 80 lb. per sq.in., the diameter of the steam-end of a pump required to deliver 1200 gal. of water per min. under a head of 1700 ft. is

$$D = 3.76\sqrt{\frac{1200 \times 1700}{100 \times 80}} = 60\ \textit{in.}$$

Therefore, since we have estimated generously, it will be sufficient to use a simple duplex double-acting pump, 60x18x60 in. The stroke of this pump being 60 in., or 5 ft., the pump will make 100 ÷ 5 = 20 strokes per min.

Ques.—A colliery that has been worked down two lifts on a north dip of 62 deg. is full of water. The slope is down 600 ft. From the mouth of the slope north a horizontal distance of 452 ft. a shaft has been sunk, cutting the seam at a depth of 840 ft. How far from the shaft level can the chambers be driven to leave a chain pillar under the slope gangway having a thickness equal to that required by the rule adopted by the mine inspectors and operators, the thickness of the seam being 10 ft.?

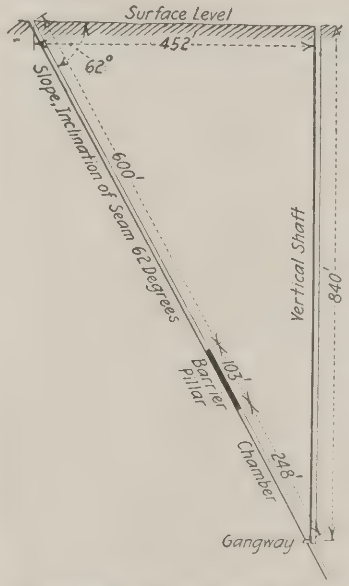

DIAGRAM SHOWING SLOPE AND SHAFT

Ans.—The vertical depth of the foot of the slope is 600 × sin 62° = 600 × 0.883 = 529.8 ft. The rule adopted for the thickness of barrier pillars in the Pennsylvania anthracite region is: Add 5 ft. to 1 per cent. of the depth below drainage level, and multiply this sum by the thickness of the seam, which gives in this case

$$t = 10\ (529.8 \times 0.01 + 5) = \textit{say}\ 103\ \textit{ft.}$$

The distance from the mouth of the slope to the bottom of the vertical shaft, as measured on the incline, is 840 ÷ sin 62° = 840 ÷ 0.883 = 951+ ft. The required length of the chambers is therefore 951 — (600 + 103) = 248 ft. In providing a safe thickness of barrier pillar in thick steep-pitching seams, as described in this question, an accurate survey is of the greatest importance.

Coal and Coke News

Harrisburg, Penn.

During the week the Governor took up several of the mining bills left for his consideration by the recent Legislature, approving some and vetoing others. The bills approved were the Crow bill providing that bituminous inspectors after having passed two examinations and serving 8 years shall be exempt from further examination, the other bill provides for new inspectors in the anthracite region: One bill vetoed was the McClure bill, providing that where clay mines are worked with bituminous coal mines, they shall come under the jurisdiction of the Department of Mines. The Governor in vetoing this bill said it was "indefinite and defective," as well as unconstitutional.

The approved bill pertaining to the bituminous inspectors is an amendment to Section 4, of Article 19, of the Act of June 9, 1911, and now reads: "The principal examination shall be in writing and each applicant shall undergo an oral examination pertaining to explosive gas, safety lamps, methods of ventilation and mine management. The questions and answers thereto in the oral examination shall be reported verbatim by an expert stenographer and typewritten fully to assist the Board in the work of rating the qualifications of the candidates; provided, that any person who has served as a mine inspector continuously for eight years and has passed two consecutive examinations for the office of mine inspector shall be exempt from taking any further examination and shall continue in said office without any further examination unless removed or suspended as provided by Article 21, of the act of June 9, 1911. Any applicant who shall make a general average of at least 90 per centum shall be deemed successful. . . ." About 17 inspectors will be benefited at once by the new law.

The bill providing for the four new inspectors in the anthracite region now reads, that "the qualified electors of the several inspection districts mentioned in this act shall elect respectively the following number of qualified persons to act as mine inspectors of this commonwealth, namely: First inspection district, 9; second district, 6; third inspection district, 1; fourth district, 4; fifth district, 2; sixth district, 1; seventh district, 1; and the eighth district, 1. Provided that the present mine inspectors in the several districts shall continue in office until the expiration of the terms for which they have been appointed or elected and the number of inspectors to be elected at the coming election shall be reduced by the number of inspectors now regularly appointed or elected and residing and serving in said district. When the terms of the present inspectors shall expire their successors shall be elected in accordance with the provisions of this act until each inspection district shall have its full quota of elected inspectors, under this act. . . ." Luzerne County will get three and Lackawanna County one new inspector.

Judge Ruppel, in deciding the appeal of Archibald Miller, of the Loyalhanna Coal Co., who was fined $100 and costs on a charge of polluting the waters at Dark Shade Creek in Somerset County, declared on June 3 that mine owners could not be held responsible for the pollution of streams by waters from the mines they own or control. In his opinion, Judge Ruppel says the complaint comes from the office of the department of the state created for the protection of the different species of fish. If it had been the purpose of the Legislature to strike a blow at the mining industry of the state, it ought to have declared its intention in unmistakable language. The act cannot be construed to cover more than what is expressly specified and the drainage of coal mines is mentioned in the act."

Some Bills Signed, Others Vetoed

The Dawson bill, including a 2½ per cent. ad valorem state tax on all anthracite coal mined or washed in Pennsylvania and prepared for market, was approved on June 7 by the Governor. One-half of the income is to be retained by the Commonwealth for highway purposes, and the other half goes to the municipalities from which the coal is taken. The Auditor General is charged with the collection of the tax. The act is to take the place of the 1913 act which is now in litigation, and is to be argued July 1 before the Supreme Court. The Auditor General is prepared to enforce the act at once and it is understood the approval is dated June 1.

In all probability steps will be taken in a short time to test the act. The bill contains a provision that it shall not effect the settlements made under the act of 1913.

The Governor also announced on the above date that he had approved the bills designed to bring the coal miners of the state under the workmen's compensation laws, and it is expected that they will be followed in a day or so by the approval of other measures. The bills announced as approved amend sections of the bituminous mine code of 1911 and portions of six acts relating to anthracite mining so as to permit the free selection of mine foremen. It was decided after conferences between legislators in charge and attorneys with the Attorney General that these acts should be signed before the workmen's compensation laws were acted upon. Both bills were settled upon in conference committees.

With the approval of the above bills, the Governor announced vetoes of the Beidleman Bill creating 21 assistant mine inspectors in the anthracite region and increasing the per diem payment of anthracite mine inspectors' examination boards from $6 to $10. This is the second time this session that he has vetoed this bill. On the first bill the Governor says the cost would be fully $100,000 and that the qualifications for the office are inadequate for the responsibility involved. The cost he said is prohibitive and the creating of offices without assurance of increased safety to the coal miners is manifestly unwise.

On the per diem bill the Governor says there is no assurance that the state would get the slightest advantage for the increased expense. He intimated that there was such a confused mass of legislation relating to the whole subject of mine inspectors, that it seemed wise not to add to a situation already unsatisfactory. The Governor thinks that the examination service should be cared for from the state-wide point of view. The method of creating examiners, their functions, their tenure, their powers, their compensation and also the method of appointing mine inspectors should be simplified, improved and unified. Until this is done, he says, it is unwise for the state to add by additional law to a situation wholly illogical and inequitable.

PENNSYLVANIA

Anthracite

Williamstown—An 8-ft. bed of hard Lykens Valley coal has been struck, and will be worked by a company of Scranton and Williamsport capitalists. In this same vicinity a bed of coal was worked about 7 years ago, but on a small scale. So far as can be ascertained, the coal just discovered contains both Nos. 1 and 2 grades of hard coal. A number of bore holes have been sunk on both Peters and Broad Mountains near here within the last 50 years. Coal has been struck at various depths and in different quantities in practically every instance, but the measures were not worked because of the lack of sufficient capital. About 20 years ago coal was struck on the top of Kittatinny Mountain, which was mined on a small scale for some years, then abandoned.

Mahanoy City—White damp overcame five miners at Park No. 1 colliery on June 5 and stretched them like dead along a gangway. Joseph Spikosky, the contractor, spread the alarm and all five were rescued alive. Fumes from heavy blasting in the Park Place strippings broke in upon them, causing the accident.

Hazleton—Men are working night and day turning the old No. 3 Lattimer breaker, now a washery, into a large coal-producing plant again, so as to handle the output from the No. 4 mine, where the breaker was destroyed by a fire at a loss of $100,000 recently. The Pardee Bros. & Co. expects to have the place fully equipped at an early date.

Bituminous

Indiana—A mine mule which served the Glenwood Coal Co. for more than 20 years, when taken out of the mine for a day of rest recently refused to return to work. David E. Williams, of Philadelphia, president of the company, ordered the animal sent to a farm near Philadelphia, where it will pass the remainder of its days in ease.

Elizabeth—The May report of business transacted at Lock No. 3 on the Monongahela River shows that during the month there passed through the lock both up and down 785 steamboats, 3082 coalboats, barges, etc., and 20,546,000 bu. of coal. The number of lockages totaled 882.

Uniontown—In ordering into blast within the last week 1009 coke ovens that have been idle for months the H. C. Frick Coke Co.'s plants are now operating to 71 per cent. of capacity. Announcement was made June 5 that 300 ovens were to be fired and on the following day orders were issued to fire an additional 200 ovens. The plants affected are: Brinkerton, Central, Collier, Colonial No. 1; Continental No. 1; Continental No. 2; Lambert, Edenborn, Leckrone, Leisenring No. 1, Leisenring No. 2; Mammoth, Marguerite, Phillips, Redstone, Ronco, Shoaf, Southwest No. 1, Trotter, York Run, Hostetter, Whitney, Buffington, Continental No. 3, Davidson, Dearth, Footedale, Leisenring No. 3, Leith and United.

There are 58 per cent. of the total number of ovens of all companies in the region in blast. Independent producers state that there is no particular activity but that there still continues a consistent demand for their product and they are anicipating an increase in orders within the next two months.

Three experts in coal-land values were appointed by Judge J. Q. Van Swearingen June 5 to appraise the coal holdings of J. V. Thompson. The men named are Julian Kennedy, of Pittsburgh; R. M. Hice, of Fairmont, W. Va., and R. C. Crawford, of McKeesport. A petition asking for the appraisers was presented to the court by counsel for Mr. Thompson's receivers.

Johnstown—Within the last few weeks the Valley Smokeless Coal Co., of Cambria County, has been cutting the timber on the hillsides about its mine openings as a means of preventing landslides. Officials of the company are removing the timber on the assumption that the winds sway the trees and thus loosen the earth and the rest is easy. The cut timber is being used about the mine for one purpose or another. It is also stated that the removal of the timber will not cause the earth to be washed down as the underbrush is sufficiently thick to retain the soil

Connellsville—The coke production of the Connellsville region recently assumed a new high record for the year with a production of 316,000 tons per week. About 8000 tons of this production represented shipments eastward due principally to export business from Baltimore and Philadelphia to South America and New Zealand.

Pittsburgh—Recent heavy rains on the water sheds of the Alleghany and Monongahela Rivers brought the water in the Ohio to a shipping stage, and the Monongahela River Consolidated Coal & Coke Co. started about 1,000,000 bu. of coal for the Southern market. The stage, however, soon receded and shipping was stopped. This was the third rise in less than two weeks during which time the coal companies along the rivers have sent between 11,000,000 and 11,500,000 bu. of coal from the Pittsburgh District, southward.

WEST VIRGINIA

Fayetteville—Kaymoor Mines Nos. 1 and 2 are undergoing repairs. It is said that both mines will resume operation on or about July 1.

State Mine Inspector John I. Absalom recently made a final inspection of the mine at Layland which was the scene of a disastrous explosion last March. It is reported as a result of this inspection that the mine is in better condition than ever before in its history, there having been made many improvements that will eliminate in large measure all possibility of a repetition of the disaster. It is not anticipated that it will be difficult to secure miners to work this operation, as many of the men formerly employed have expressed a preference for this mine.

Thacker—A disastrous fire occurred at the operation of the Thacker Coal & Coke Co. recently, destroying the homes of J. B. Gerald, L. D. Baker, and three or four other houses which were unoccupied but which belonged to the company. The loss entailed will amount to several thousand dollars which was covered largely by insurance. The origin of the fire was unknown.

Morgantown—The Preston County Coke Co. has been firing qute a number of ovens of late, and will shortly begin shipping several cars of coke daily. The plant has been practically idle for several months.

Moundsville—The working force of the Mound City Coal Co. is being daily increased. For some time past the management has been adding a few miners each day to the pay roll. It is stated that this operation has business enough ahead to keep it working to its capacity.

Gary—The United States Coal & Coke Co. recently held its semi-annual first aid contest. Ten teams, nine white and one colored, all composed of employees of the company took part in this contest. Five events were selected by the judges from a list of 20 in which the various teams were judged, all teams operating at the same time. The first prize was awarded to the team from No. 10 Works, while Works Nos. 3 and 11 tied for second place. This company maintains a first-aid and mine-rescue station in which classes are being trained daily.

Wheeling—The West Virginia Coal Mining Institute will hold its annual convention in Wheeling on June 16 and 17. It is proposed to make this an important gathering of the organization. The program as now arranged is such that business and pleasure may be combined, the one not interfering with the other. Many valuable papers will be presented, and an enjoyable time is anticipated.

Fairmont—The holdings of the Consolidated Coal Co. in this vicinity were inspected recently by a large group of Eastern capitalists. The party was particularly interested in the development of the Helen's Run field, where some of the biggest mines in this section are being opened up. The visitors left for the Elkhorn field after inspecting the mines in this section.

ALABAMA

Gadsden—Coal mines throughout the Gadsden district are being worked at full capacity. Extra operations at the mines at Altoona are under way. One heading is being driven there that will require several years to complete.

TENNESSEE

Petros—The Petros Coal Mining Co., of Petros, Tenn., was placed in the hands of a receiver by Judge Will D. Wright of the Chancery Court of Knoxville, Tenn., on June 1. A. H. Wood of Petros, president of the company, was appointed receiver.

KENTUCKY

Wheeler—The Ty Wheeler Coal Co. was placed in the hands of a receiver, June 5. John L. Boyd of the Proctor Coal Co., Knoxville, Tenn., who handled some of the coal, was named receiver. Mr. Boyd is also president and treasurer of the Bear Wallow Coal & Coke Co., and treasurer and general manager of the Prudential Coal Co., both operating in Tennessee.

Whitesburg—Some 200,000 acres of forest land in Letcher, Pike, Knott and Floyd Counties, as well as Dickenson and Wise Counties, Va., already have been pledged to the Eastern Kentucky Forest Fire Association, according to announcement made at the recent meeting here of that organization. J. E. Barton, state forester, presided at the meeting at which the plans of the association to carry out their ideas for protection of the timber were discussed.

A special train recently brought a considerable party of Consolidation Coal Co. officials, with a number of financiers and coal men. to Jenkins and vicinity, to inspect the mines in that district. It is said that the purpose of this visit is to make a number of increases and extensions in this field, and it is expected that considerable holdings in coal land will be developed in the near future. There is considerable activity in the eastern Kentucky coal field, especially in the Elkhorn District.

Hopkinsville—The Terry Coal & Coke Co. announces that contract for intended sale of its mines and property at Mannington, Ky., was made on Mar. 30, last, and the deal is to be closed by a cash payment before Aug. 10, next. The contract protects all stockholders for 20 years so they can buy their coal at the mines on the same terms that obtained with the Terry company. The purchasers have taken care of the property and the stockholders have approved the sale, which is to be at a price sufficient to pay the bondholders in full and effect a settlement with all creditors.

Frankfort—The Court of Appeals has reversed a judgment given by the Ohio County Circuit Court for $15,000 damages against the McHenry Coal Co. to Thomas Taylor, miner. Taylor was injured by falling slate and the jury in reaching its verdict was permitted to consider loss of time, which was not specially pleaded in the suit. Figured up to the time the suit was filed the time lost would have been $116.48 but the Court of Appeals held that there was no way of discovering how the jury may have computed it.

OHIO

Bellaire—The Pultney mine of the George M. Jones Coal Co. recently resumed operation. This mine has been closed since Apr. 1, 1914. Recently, however, a number of necessary repairs have been made and the mine is now in fairly good condition. It employs about 370 mine men when operating at full capacity, but this number will not be given work for some time.

Columbus—J. M. Roan, Ohio mine inspector and safety commissioner, has issued a bulletin which deals with records kept by operators of their employees. Mr. Roan announces that he finds after investigation that mine managements are very careless in regard to keeping records of the men who are working in the mines, permitting them to enter in the morning and leave in the evening, without any record having been kept. He further finds that persons have been permitted to enter mines who are not employed and without having secured a permit to do so. This is a dangerous practice and should be stopped. He holds that all employees entering in the morning should be checked in and out on leaving in the evening. This can be done without extra expense to the operator, and is to the operator's interest, as well as to that of the miner. This especially applies to shaft and gaseous mines. Mr. Roan holds that under no circumstances should a person be allowed to enter a mine who is not employed by the company until he has been given a permit to do so by the mine boss or superintendent and points out the danger of such a practice.

Coshocton—Trouble over the price of "dead work" at the Warwick mine, near Coshocton, recently resulted in the walking out of about 100 miners. A dispute arose over the price for handling the false roof.

Athens—Sunday Creek mine No. 211 was sealed by officials of the state mining department after a fight against a fire which is raging in the old workings of the mine. The fire broke out May 29 and nearly a score of men were overcome by the gas while the main shaft was being sealed. The mine must remain sealed for from three to six months and perhaps longer. Open-flame lamps are declared to be responsible for the fire.

St. Clairsville—The settlement of the eastern Ohio strike is causing a boom in the Belmont County marriage-license business. The 15 days from the settlement of the strike to June 1 show twice as many licenses issued as during the first half of the month.

INDIANA

Indianapolis—The Union Trust Co. has been appointed receiver for the Marion Coal Co. of this city. The assets are given as $15,000 and the liabilities at $18,000.

Terre Haute—Five hundred miners employed at the Speedwell and Lower Vein mines have been called out on strike. They allege that the superintendent has been forcing the men to pay $10 for jobs, discharging them and compelling them to pay it over again.

Three deeds transfering the coal rights of 376 acres of land in Fayette township in the northwest part of Vigo County have been filed for record here, although they bear date of 1910. The Bunsen Coal Co., an Illinois corporation, now holds the rights.

ILLINOIS

Herrin—By the closing down of two large mines here 765 miners have been thrown out of employment. Several hundred have been thrown out of work at Carterville by the closing of the big Burr mine there.

Belleville—The Superior coal mine, near here, has resumed after having been closed down a long time. Resumption was made possible by the closing of a contract with the East St. Louis Suburban Electric Ry. Co. for the disposal of the screenings. The mine employs about 100 men.

Springfield—Several mining properties in the Springfield district were temporarily disabled because of a terrific storm which swept over that section last week. As a result some of these mines will be idle for a week or 10 days until repairs can be made. The mines of the Peabody Coal Co. at Sherman and Pawnee resumed operations for one day recently in order to furnish sample shipments of coal for the Union Pacific Ry., which is about to award a contract for coal to be supplied through the Kansas City Terminal amounting to 30,000 tons per month.

FOREIGN NEWS

Fairbanks, Alaska—George A. Estabrook, owner of a placer claim on Chicken Creek in the Forty-mile district on the upper Yukon, has been granted the first permit to mine coal in the interior under the new Federal leasing law.

Toronto, Can.—The Crows Nest Pass Coal Co. of Fernie, B. C., is about to install a complete system for the treatment of byproducts, which have so far received little attention. President Elias Rogers has been in Europe securing plans for the necessary machinery. The company will produce ammonia, ammoniacal liquor and benzol ready for marketing, but for the production of tar an additional plant will be required.

PERSONALS

Michael Scollard of Brazil, Ind., has been appointed Indiana state inspector of mines.

Stephen H. Payne has been placed in charge of the newly established New York office of the Hirsch Electric Mine Lamp Co. at 30 Church St., New York.

E. L. Douglas, of Hazard, Ky., general superintendent of the Harvey Coal Co., developing a coal lease at the head of First Creek in Perry County, Ky., on the First Creek Branch of the Lexington & Eastern division of the Louisville & Nashville R.R., will shortly change his address to Typo, Perry County, Ky.

Kieran Donahue, of Girardville, Schuylkill County, Penn., has been notified that he has passed the examination for mine inspector, and it is likely that he will be appointed to succeed John Curran, inspector of the 18th anthracite district, who recently died. Thus far none of the new applicants except Donahue have been notified of success.

Chief Earl Henry was recently named by the Governor of West Virginia to succeed himself as inspector of the Bureau of Mines. Mr. Henry then announced the appointment of three mine inspectors as provided for by the enactment of the new mining code. These men were J. G. Vaughn of Charleston, Clarence N. Orr, of Kingwood, Jackson County, and Samuel McMahan, of Wellsburg, Brooke County. It is said that Mr. Henry had 400 qualified applicants for the three positions.

OBITUARY

The body of William Woods, fireboss at the Blackwood colliery near Pottsville, Penn., was found on June 5 in the sump at the foot of the slope. It is believed he was examining the pumps when he fell into the water.

William Spence, who was known as the oldest and was at one time the best known coal dealer in Brooklyn, died at his home in that borough recently. Mr. Spence was 87 years old and had been a resident of Brooklyn for about 80 years. His father, William Spence, opened the first coal yard in Brooklyn, at the corner of Flatbush Ave. and Livingston St., then well outside of the built-up district. The yard is now out of existence but the business is being continued under the name of William Spence & Son, with realty as an added department.

John W. Reid, aged 57 years, superintendent of the Old Forge district of the Pennsylvania Coal Co., died on June 5 at Dr. Reed Burns' private hospital at Scranton, where he was under preparatory treatment for an operation for obstruction of the bowels. He had been ill for several weeks. He was a native of England, but came to Pittston when a boy and began work for the Pennsylvania Coal Co. as a door tender. He had worked 44 years continuously for this firm and had risen by faithful application from the lowest position to that of district superintendent, which he had held for 5 years. He was a resident of Moosic.

INDUSTRIAL NEWS

St. Louis, Mo.—The offices of the Missouri & Illinois Coal Co. at St. Louis have been moved from 815 Mermod & Jaccard Building to 1823, 1824 and 1825 Railway Exchange Building.

Buffalo, N. Y.—It has been planned to hold the annual meeting of the Allegheny Valley Operators' Association in Buffalo at the time of the Roberts coal picnic, which occurs on July 17.

Columbus, Ohio—Gross earnings of the Toledo & Ohio Central R.R. for April were $340,000 as against $325,691 for April, 1914. The gross for the first four months of the year was $1,314,629, a decline of $246,175 from the first quarter of last year.

Knoxville, Tenn.—The J. D. Fate Co., Plymouth, Ohio, manufacturer of the "Plymouth" gasoline industrial locomotive, has established an agency at Knoxville, Tenn., 922 Holston Bank Building, in charge of C. S. Oldroyd, formerly with the Goodman Manufacturing Co.

Kansas City, Mo.—The Kansas City Terminal R.R. was recently granted a permit by the city for the construction of a new coal station. The station is to be built of reinforced concrete with a concrete roof. The building will cost $20,000 and is to be completed by Aug. 1.

Birmingham, Ala.—The Sloss-Sheffield Steel & Iron Co. has received a contract for 200,000 tons of coal for the Seaboard Air Line for delivery within 12 months. This company also recently closed a contract to furnish 14,000 tons to the New Orleans Street Ry. Co., New Orleans, La.

Terre Haute, Ind.—It was reported some time ago in "Coal Age" that the properties of the J. K. Dering Coal Co. in Sullivan, Vigo and Vermilion Counties had been sold. This was erroneous as the properties in question belonged to the Dering Coal Co. of Delaware, the J. K. Dering Co. of Chicago having no interest in them whatever.

Somerset, Penn.—It has been announced that the Quemahoning Coal Co. has been awarded the contract by the U. S. Government for the furnishing of fuel for the United States navy at Annapolis, Baltimore and Philadelphia. The mines of the company at Ralphton and Husband will be worked 24 hr. a day in order to fulfill the requirements of the contract.

Bluefield, W. Va.—The Crozer-Pocahontas Co. has been awarded a contract for 400,000 tons of coal to be delivered during 12 months beginning July 1, to the Navy Department at Lamberts Point. Coal under this contract had heretofore been furnished largely from Pennsylvania fields, and this contract in large measure means a clear increase in the business of the Pocahontas region.

Moundsville, W. Va.—The work of enlarging the shaft of the Mound City Coal Co. which was recently begun, is progressing rapidly. This shaft will be made wider and larger, and will be concreted from the rock to the surface. The contract for the cement work was recently awarded to the Crystal Sand & Cement Co. of Moundsville. It is anticipated that the work will be completed in about three weeks.

Coalfield, Tenn.—The Harriman & Northeastern Coal Co., a new firm, has leased a large body of coal land near here and has completed surveys for a side track and tramways. Felton Hatfield, president, is an experienced operator, being connected with the Brushy Mountain prison mines. It is stated that W. E. Brinkerhoff, former superintendent of the Coalfield Coal Co., will superintend the new operations.

Philadelphia, Penn.—For the first time in history the New York Central R.R. has representation on the board of one of the important anthracite roads. At the meeting of the board of directors of the Reading company on June 1, Alfred H. Smith, president of the New York Central, was elected to take the place of Charles C. Harrison, resigned. Mr. Smith was no doubt chosen to represent the Lake Shore interests in the Philadelphia & Reading Ry.

Pittsburgh, Penn.—The assumpsit suit of James A. Paisley, of Cleveland, Ohio, against the Rail & River Coal Co. in the District Court of Pittsburgh resulted in the award by a jury of a verdict for $403,523. This amount includes the verdict of $339,000 with interest at 6 per cent. from Apr. 1, 1912, to June 3, 1915. The suit arose over a 10 per cent. commission on the sale of coal mines and properties to the Grand Trunk Development Co. of Canada through Charles W. Hayes, of Toronto.

Philadelphia, Penn.—The increase of bituminous coal exports from this port continues. Recently several ships took on cargoes of coal for the Italian Government. The British Government has placed an embargo on all shipments of native coal to other than British possessions. As a consequence English contractors are making heavy purchases in the United States to fill their foreign contracts. The great difficulty is to secure sufficient bottoms and when the vessels are available the rates are quite stiff.

Huntington, W. Va.—Referee T. R. Shepherd recently held a deed of trust for $14,813, on the property of the Mingo Washed Coal Co. of Matewan to be valid. After the Mingo company had filed a petition in bankruptcy, the creditors made an effort to have the deed of trust held by the Merchants' Bank of Pittsburgh thrown out. Following several hearings Referee Shepherd announced his decision. About $30,000 in claims has been filed against the property of the Matewan concern, the property of which has been appraised at $23,389.

Uniontown, Penn.—It is understood here that the sale of some 76 acres of J. V. Thompson coal land located at Revere recently at the rather high price of $2000 an acre to the Rainey interests is but the forerunner of some large transactions which will clear the commercial horizon of this and nearby counties. No sooner was the sale confirmed by the New York court than negotiations were begun looking toward acquiring a large portion of Fayette and Greene Counties by a syndicate representing the most powerful coking interests of the country. Definite announcement of the result of these negotiations is anticipated within a short time.

Cincinnati, Ohio—The famous case of McKell against the Chesapeake & Ohio Ry. Co., the third trial of which resulted some time ago in a verdict of $125,000 in favor of the plaintiff, and which was affirmed by the United States Circuit Court of Appeals, has virtually been ended by the action of the United States Supreme Court in denying the defendant's application for a writ of certiorari. This means that the judgment, with interest and costs, must be paid, the total amount due being about $135,000. The case has been pending since October, 1902, and has excited much interest.

Toledo, Ohio—The steamer "Viking" was sunk, with more than 2000 tons of hard coal aboard, about a week ago. The steamer arrived here from Buffalo with her cargo and the steam was blown from her boilers one night for the purpose of renewing her funnel. The deck siphons were in some manner overlooked and being left open and under water, the vessel filled during the night and sank in 25 ft. of water at the docks of the Ironville Dock & Coal Co. After four days of hard work including the building of a cofferdam around the vessel it was successfully floated.

Philadelphia, Penn.—Another of the large mining companies recently announced that, in accordance with the recommendation of the Bureau of Mines, it has discarded the use of fuses for exploding blasts and substituted in their stead electric batteries. This, of course, is brought about on the score of safety to the miners. However, another important reason may have actuated the change, although not probably so well known. Miners have been at times so careless in handling fuses that the latter have found their way into coal prepared for market, which has resulted in several instances in claims being presented for damages due to exploding furnaces and stoves.

Baltimore, Md.—The business of the Wells Light Manufacturing Co., Jersey City, N. J., has been acquired by the Alexander Milburn Co., of Baltimore, Md. Repair parts for outstanding Wells lights will be manufactured and supplied in the future by the Alexander Milburn Co. from its Baltimore factory, and complete Wells oil lights will also be furnished where desired, in conjunction with the standard Milburn acetylene lights. The manufacture of Wells oil preheating burner outfits will be continued by the Milburn company and sold in connection with Milburn oxy-acetylene apparatus. The Wells lights and Wells preheating devices have been on the market for about 20 years, and have occupied a leading place among oil-burning equipment of their kind.

Birmingham, Ala.—Walter Moore, of Birmingham, and Eastern associates have just purchased from Steiner Brothers and Frank Nelson the Empire Coal Co., whose holdings consist of 17,000 acres of coal lands valued at one and a half million dollars. The land is some of the most valuable in the state. It is 22 miles from Birmingham on the Frisco railroad near the Southern, also the Warrior River. The name of the company will remain the same. The new owners own the Panama Coal Co. with 27,000 acres of coal lands adjoining their new possessions. The output from the combined properties is 1500 tons per day, and the present intention is to increase the tonnage to 2500 tons per day. Walter Moore is president and general manager. W. C. Hamilton, secretary and treasurer.

New York, N. Y.—The Mashek Engineering Co. of No. 90 West St., New York, manufacturer of metallurgical, coal-mining and briquetting machinery, reports that it has completed and recently shipped a complete briquette-plant equipment, capacity 20 tons an hour of small size domestic fuel, to the Delparen Anthracite Briquet Co. of Parrott, Va., and another plant equipment of the same size to the Stott Briquet Co. of Superior, Wis. It has recently secured orders for complete briquetting plants from the Gamble Fuel Briquet Co. of Harrisburg, Penn., and from the New Jersey Coal Mfg. Co. of Camden, N. J. It also reports an increasing number of inquiries on briquetting machinery from prominent coal producers. The business prospects appear brighter now than they have at any time during the last four years.

Bluefield, W. Va.—The shipments of coal from Hampton Roads during May proved to be the greatest for any one month on record, amounting to a grand total of 1,307,747 tons. Of this amount the Norfolk & Western piers dumped 716,002 tons, the Chesapeake & Ohio piers 372,472 tons, and the Virginian piers 219,173 tons. The May shipments were at the rate of approximately 16½ million tons per year, while their value during May reached approximately $4,000,000. Steady increases in coal shipments from Hampton Roads have taken place for several months past, and it is predicted that these will increase for some time to come. Many countries which formerly depended on England for their fuel supply, are now obliged to come to the United States for coal. During May in addition to the marked increase in the export of coal to Europe, cargoes for South America were noticeable in increasing numbers.

Coal Trade Reviews

General Review

May anthracite tonnage suffers a sharp decline and prices are weak. Bituminous exports approximately doubled but situation still unsatisfactory. Outlook more encouraging but hesitating over the crisis in diplomatic circles.

With the strongest sizes of anthracite selling well down to the April circular and supplemented by additional inducements in the shape of long-term credits to the buyer, there is little of an encouraging nature in the hard-coal situation. It is probable that the unseasonably cool weather, which induced some buying, has prevented a more or less general demoralization; as it is the trade is about as dull as it well could be. The steam sizes are subjected to the same pressure that marks the bituminous trade except in the rare instances, where manufacturers are crowding operations on rush war orders. Contrasted with the heavy shipments of April, the May tonnage showed a decline, pulling the gross shipments for the year down to half a million tons less than last year. Tangible evidence of the strained conditions in diplomatic circles is adversely affecting the situation still further.

A general smashing of all previous high records at the chief exporting points occurred last month, but it is clear that this off-shore business cannot attain to sufficient volume to relieve the pressure on the bituminous market. On the other hand it is believed that some effects of the long talked of improvement in industrial conditions are beginning to be felt, particularly in New England. There are well defined evidences of an advancing tendency, although consumers as a rule are well stocked up, and it will take a sustained movement for some time to clean up the surpluses, and create any activity. In the meantime the coal trade is marking time with the agencies watching developments closely and competing aggressively for any new business that appears. The Pittsburgh district is again experiencing beneficial results from the export trade and there is a better feeling in steel circles, which is affecting the coal market.

The stronger position of the West Virginia operators because of the heavy demand at Tidewater is having a steadying effect upon the Ohio situation, which is being further supplemented by an exceptionally favorable crop outlook in all directions. There does not seem to be a large volume of coal emanating from the districts where the labor situation has been cleared up and prices are generally maintained at the circular, although this is at a low level.

There is a barely perceptible improvement in the Middle West. Consumers are absorbing slightly more coal, while requisitions on contracts are a trifle heavier. Railroad buying as a rule, continues at a minimum, although one important system has just placed a large storage order and a considerable tonnage will be required by the middle of next month when crops begin moving. Additional manufacturing plants are beginning to resume operations on a curtailed basis, while others are increasing their working schedules, although none of the improvements are of large proportions as yet. It is generally felt that the market has finally turned the corner, and although the improvement may be subject to future developments, it will be well maintained and along conservative lines.

A Year Ago—Anthracite storage bins glutted with steam sizes and initial curtailment in operations inaugurated. Further shrinkage in bituminous demand and trade continues under heavy stress. Improvement in Lake shipping creates a more hopeful undertone.

BUSINESS OPINIONS

BUSINESS CONDITIONS

Situation hinging entirely on developments in the international situation. Highly favorable crop report. Steel operations show further expansion.

Dun's—A waiting policy always hinders business to some extent, and the hesitancy engendered by the foreign complications tends to arrest the progress warranted by the intrinsic soundness of underlying conditions. Even though the weather has proved an added drawback in many sections, the forward movement has not been wholly checked.

Boston News Bureau—The situation continues to be dominated by the pending diplomatic negotiations with Germany. But in the meantime the country is gradually pushing forward. War orders remain at their maximum, and general trade is increasing all the time in volume. Some of the closest students of conditions are becoming confident that we are facing a period of inflation. This would not only mean higher prices for commodities but increased values for securities.

Bradstreet's—Final distribution, checked in the East by unseasonable weather, has been revived in the West by sunshine and warmth; speeding up is the rule in industrial lines, and war orders, taken on close to a cash basis, tax the capacity of many plants, spread activity to other lines, make for competitive bidding for skilled labor and hence unemployment is steadily decreasing.

The Crop Report—Winter wheat shows a slight deterioration but the wheat area planted is 59,417,000 acres as compared with 53,377,000 a year ago, and the indicated crop is 950,000,000 bushels as against 900,000,000 a year ago. The estimated oat crop is 1,288,000,000 bushels compared with 1,216,000,000 for the same period a year ago.

Marshall Field & Co.—Sales and current shipments for the week show a very satisfactory comparison with those of the same period a year ago. More customers have visited the market than during the same week last year.

Coke—Increased steel operations have precipitated a sudden large inquiry for second-half furnace coke. Higher prices are expected soon and a labor shortage is anticipated after a moderate increase in production. (For complete details see p. 1046.)

Am. Wool and Cotton Reporter—The wool situation is decidedly better. Wool is plentiful, but very firm and advancing. Big sales took place all through the week; as for some time, sales were chiefly confined to foreign wools. The dye stuffs situation is still serious. The interest in war contracts seems to have declined to a certain extent. In the cotton goods market sales have been slightly larger than a week ago. Distributing is pretty regular. There is a tendency to postpone placing contracts for future delivery and an increase in spot business.

Engineering News—For the first time this year the contemplated building operations from plans filed aggregate a larger total than in the corresponding month last year. In 69 cities, all over the United States, the cost, from plans filed in May, amounts to $69,326,000, compared with $67,477,000 in the same month last year.

Iron and Steel—The decision that the United States Steel Corporation was not a monopoly under the terms of the Sherman law was the most welcome piece of news brought forward in many months. The placing of the Pennsylvania order for 165,000 tons of rails on Wednesday clears up a matter of long standing. This is one of the very large orders for rails placed in recent years. The production of iron in May amounted to 2,263,470 tons according to "The Iron Age." This is the largest output in any single month since April, 1914.

A change for the better, as far as increasing the capacity of steel plants is concerned, may now be expected and operations are already increased to about 80% capacity. It is recognized that the capacity of the steel companies has not kept pace with the growth of the country. Sellers of pig iron are more cheerful but there have been few sales. The market for finished products is much stronger particularly small rounds and materials for shipment abroad.

ATLANTIC SEABOARD

BOSTON

Hampton Roads shippers disposed to make competitive prices and in close touch with buyers. Export demand sags a little. Industrial situation shows slight improvement. Georges Creek still coming forward slowly. Pennsylvania grades and anthracite unchanged.

Bituminous—The present market on Pocahontas and New River can be described as marking time. The recent successful bid of one of the Pocahontas factors for furnishing naval colliers shows that West Virginia operators intend to remain in the market on a competitive basis. A large share of this contract last year was let on coal from central Pennsylvania, and it was expected the same thing would occur this year. Buyers in this territory are closely following all such developments, but while they are still tempering the market, no sales of any consequence can be reported. The fact that the export business is getting spasmodic again on account of the shortage of steamers keeps sales agents in close touch with buyers here. Aside from scattering instances, however, the price level f.o.b. Hampton Roads remains about the same as a week ago.

Not only is the New England industrial situation somewhat improved in special lines, but there is increasing evidence of more confidence in the outlook for fall and winter. Several lines of textiles report a better demand for goods, and if that is sustained for a few months it will give a much different tone to the coal situation than has prevailed the past year or so. For the present not much effect is expected because stocks of coal are large and every manufacturing plant having a contract has been crowded to accept deliveries.

On cars, for inland delivery, the demand is light. There is less coal offering, however, and prices continue as when last reported.

The heaviest volume of Georges Creek is still being routed to Baltimore for export, only small amounts coming through via Philadelphia and New York. New England buyers are now obliged to be forehanded about arranging for shipments of this grade.

The quality grades from Pennsylvania districts are coming forward fairly consistently. There is no snap to the demand, but the aggregate tonnage is considerable. The grades that sell at less prices are druggy in every direction. The strengthening in Hampton Roads prices has not progressed far enough to cause any extra demand for the steam coal shipped via Philadelphia and New York.

Water Freights are about stagnant and reflect the dullness of the trade; 40c. is now the top rate out of New York for Long Island Sound ports.

Anthracite—Slow loading is general with the larger shippers, but more because of light mining than for any other reason. If output continues on the same basis most of the companies will have business enough for the whole of June. The cool weather is having a favorable effect on retail trade.

Current prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.75@2.85
Boston†	....	....	....	3.70@3.78
Providence†	....	....	....	3.60@3.73

* F.o.b. †On cars.

PHILADELPHIA

Only continued cold and rainy weather has prevented utter stagnation. Despite offerings at low prices there is practically no response from buyers. No marked change in bituminous.

Anthracite—If anything the collieries as a general thing are on shorter time than last week. The unusual weather, cold and rain, have had a slight effect on business which would otherwise be almost at a standstill under normal conditions.

Of the domestic sizes stove, as usual, is well taken care of under restricted mining, although a few offers of this size are noted at the April circular with long-term credit. Even with these inducements there do not seem to be many takers.

About $2 continues to be the ruling price of pea coal, with offers right along of somewhat less than that figure, although $1.75 seems to be about the minimum. The continued low price of pea coal has tended to curtail the movement of the family grades; many retail dealers are offering this size at a price which shows a wide gap between it and egg, stove or nut. There are many who believe that the $2 price will continue until the first of the year, when the expiration of the agreement with the miners at the end of March will result in the storing of coal for reserve and thus cause a stiffening of the entire market.

The steam sizes still lag, due to the fact that many of the factories are still on reduced time, the only plants working to capacity being those affected by the war.

Bituminous—There is no particular action, but operators are becoming more hopeful. War orders and the recent decision in favor of the Steel Corporation have had the effect of putting courage into the business and an increased tonnage is naturally looked for. Tidewater movement shows a tendency to increase, especially since Italy's entrance into the war, which is calling for the exportation of considerable tonnage to that nation.

The standard prices rule as follows, with individual offerings of from 10c. to 30c. from those quoted:

	Line	Tide
Broken	$3.20	$4.45
Egg	3.45	4.70
Stove	3.70	4.70
Chestnut	3.85	4.95

NEW YORK

Outputs closely regulated and little spot bituminous is being offered. Anthracite fails to show any improvement. Stocks plentiful and mine operations curtailed.

Bituminous—Shippers are waiting for better conditions and have about decided that they will not be realized until fall. Operators are endeavoring to prevent overstocking the market. Those in the upper fields are working about half time while the mines in the Pocahontas, George's Creek and New River regions are doing a trifle better, due to the increased export demand.

Operators in southern West Virginia and Kentucky continue to have labor troubles. The matter of car shortage is not one of moment at this time. There has been some good bunker business. Gas coal is in good demand but prices are low.

The local docks continue to be well supplied, but there is no surplus to cause any trouble. Contract holders continue to take more than their contracts call for. Shipments to Long Island Sound and New England points continue normal. Demurrage coal is scarce and the spot market remains quiet. Quick buyers are able to pick up a few cargoes at low prices.

The export situation continues to be the feature of the market. Shippers are optimistic and look for a still heavier call. Bottoms are not more plentiful than last week and rates remain about the same. New inquiries continue to be received.

Prices on the various grades of bituminous coal have not changed materially from last week which we continue as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	3.00@3.10	3.00@3.10	3.00@3.10	1.45@1.55
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.10
Broad Top Mountain				1.10@1.45
Cambria County:				
South Forks	2.90@3.05	....	....	1.35@1.50
Nanty Glo	2.75@2.80	....	....	1.20@1.25
Barnesboro	2.65@2.70	....	....	1.10@1.15
Somerset County:

Anthracite—It is difficult to find any signs of improvement in the anthracite coal market. Indeed, some shippers believe the situation, especially at Tidewater, is duller than a week ago. Some inland dealers complain that shipments are not as prompt as they might be. Salesmen report a better demand inland than locally.

Most of the companies are endeavoring to work their mines on an average of about four days a week, while many of the individuals are not doing as well. Efforts are being made by all to prevent a slump in the market. The outlook for the balance of the month is not promising. In some instances coal has been quoted by individuals at April circular but these are scarce.

The curtailed operations do not seem to diminish the stock of steam sizes. Pea coal is selling at considerable below the companies' circular. The buckwheat sizes are much in evidence and a quick buyer can supply his immediate requirements at almost his own figures.

Quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.75		$4.80	
Egg	5.00	$4.80	5.05	$4.85

ANTHRACITE OPERATIONS

The "Philadelphia News Bureau" reports mine operations at the anthracite collieries as follows:

Philadelphia & Reading Coal & Iron Co.—This company operated three days during last week.

Susquehanna Coal Co.—This company operated three days during last week.

Lehigh Valley Coal Co.—The mines of this company were closed on Monday and Tuesday of this week and it is the present intention to run about half time during the balance of the month.

HAMPTON ROADS

Dumpings for May break all previous records. Movement heaviest to Italy.

Dumpings at tidewater for the week, while heavy, have hardly come up to tonnage anticipated. As has been the case for some time Italy has taken the largest percentage of the movement although shipments for the Canal Zone come a close second. The "Achilles," a new vessel and a sister ship of the "Ulysses" which recently loaded a cargo of over 12,000 tons for the Canal Zone, has loaded for her trial trip. The movement coastwise has been chiefly to Boston, Providence, and Portland, although of course smaller cargoes have gone to the other New England ports as far north as Bangor. The shipments to New England have consisted of New River and Pocahontas mine-run, nut and slack and also a small amount of the high volatile coals. Prices at tidewater are practically stationary and there is still somewhat above the normal accumulation on hand.

During the month of May all records for heavy dumpings were broken, 1,307,747 tons being moved over the Hampton Roads piers. Of this quantity the Norfolk & Western dumped 716,002 tons, the Chesapeake & Ohio 372,472 tons and the Virginian 219,273 tons. Of the total movement over 440,000 tons went foreign, Italy being the heaviest buyer.

The following vessels have cleared from Hampton Roads during the past week:

Norfolk			Norfolk		
Vessel	Destination	Tons	Vessel	Destination	Tons

[1] Nine days.

OCEAN FREIGHTS

During the past week freight rates were slightly easier on large steamers, both to the Plate and to the Mediterranean, principally owing to the scarcity of large orders; on the other hand rates on small boats to South American ports were firm. Freights to other destinations are unchanged.

To	Rate	To	Rate

W. W. Battie & Co.'s Coal Trade Freight Report.

BALTIMORE

Trade is full of conflicting reports, largely because of the large export business which is breaking all records. Home trade undoubtedly dull.

The companies figuring in export trade are undoubtedly handling much coal, while those relying entirely on the home market are for the most part dull. This includes a large number of companies that sell to the trans-Atlantic liners which are now running very irregularly. The May report of the Consolidation Coal Co., one of the heaviest shippers in the foreign trade, shows that it broke the previous production record by nearly 100,000 net tons.

May exports from Baltimore broke all records. A total of 232,866 tons was sent to foreign account. Italy took the largest amount, 89,105 tons. Argentina was second with 80,590 tons.

The domestic market is very flat and little new business is developing. Low-grade West Virginia and western Maryland coals are still offering very cheap to the trade at the mines. Pennsylvania line coals are a little stronger.

The following charters were announced the past week:

Note—Steamers are indicated by **bold face type**, all others being schooners.

LAKE MARKETS

PITTSBURGH

Considerably increased inquiry for export purposes, chiefly to Italy. Manufacturing demand slightly improved. Lake shipments light. Operations at about 60 per cent., with no shortage of men or cars.

Pittsburgh district shippers, particularly those in the Connellsville region, have been finding a much heavier demand for export coal, doubtless arising chiefly from the entrance of Italy into the war, with the consequent stoppage of coal shipments from Germany to that country. There are decidedly cheaper markets for Tidewater shipment, of course, but some of the export requirements can be met by only a few districts.

There is a slight improvement in coal demand from manufacturers, and particularly the steel industry, as after a short halt the improvement in steel is now proceeding apace.

Shipments in the Lake trade continue light and while they are increasing somewhat it seems probable that anything like full shipments will hardly be reached before about Aug. 1, early prognostications having been that the normal rate would be attained by about July 1.

Mine operations are at a slightly better rate, probably averaging close to 60% of capacity. There is no shortage of labor, of course, with such operations. Car supply is fair but does not seem to be excessive.

No interest has been revived in the contract market, prices for free coal being so much below contract-asking prices, which remain about $1.15 for mine-run to Apr. 1 and about $1.15 for ¾-in. coal for the Lake season. Free coal continues to be quotable about as follows: Slack, 55@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Agencies pushing hard for business and orders difficult to obtain. Anthracite also heavy and Lake trade is slowing up.

Bituminous—The general report is not satisfactory. Business is difficult to obtain and very little comes in unsolicited. Agencies are pushing hard for business and prices are so badly cut that profits are small. Former predictions of a revival in buying after the end of June are no longer heard and not much is anticipated now before the fall. As a rule the bituminous mines are running half time or less and in some instances it is hard to give the miners enough work to support them.

There is some coal that brings the full circular price, but it must be of the highest quality and in the hands of capable salesmen. Quotations are based on $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack. Allegheny Valley sizes are about 25c. lower than Pittsburgh. The light demand for coal in the Lake trade at ports west of here throws a large amount of it on this market that would otherwise not come here.

Anthracite—Everything in the trade is about as dull as it can be. There was a little improvement at the end of May on the part of a few jobbers who wanted to take advantage of the ten-cent difference in price, but that promptly subsided when June came in.

The activity in Lake shipping is not quite what it was, though the week's total is only a trifle under 100,000 tons. For the month of May the shipments amounted to 548,437 tons and for the season, 802,142 tons, as against 603,446 tons to June last season. Some of the shippers have about stopped forwarding anthracite to the Upper Lake docks, as it is piling up fast there. Within the last few days it has come in more slowly from the mines, either on account of mining suspension or demand eastward.

TORONTO, CAN.

Market continues well stocked and prices remain at a low level.

The yards continue well stocked in all lines and supplies are coming forward freely both by rail and water. The water in the harbor is 18 in. lower than usual at this season and on 3rd inst. the collier "Veronica," from Oswego, ran aground at the entrance at Eastern gap in about 12 ft. of water. The only change in prices is an advance of 50c. for cannel coal. Quotations for best grade are as follows: Retail, anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6. Bituminous, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $8; wholesale f.o.b. cars three-quarter lump, $3.56; screenings, $2.90.

TOLEDO

Both ore and coal movements light. Dealers anxiously watching for railroad contracts.

Toledo is still a quiet market and this condition is likely to prevail until the Lake coal starts moving more freely. The domestic market is slow but Kentucky and West Virginia coals are in some demand for threshing purposes; the large crops would indicate that this trade will be heavy when fully under way. Steam trade continues quiet. Prices on practically all grades are running close to the list in actual sales although the listed quotations are low.

Lake coal passing through here this season amounted to 1,108,725 tons and the Canadian shipments amounted to 92,487 tons. These figures show considerably less than a normal movement. Occasional small contracts are coming in from private individuals for summer coal and small institutions which are placing fair orders. Larger contracts will not be let until later in the summer although dealers are expecting some railroad orders of considerable size to come in at any time.

COLUMBUS

A slight improvement reported from most districts. Prices steadier and the tone of the trade is better. Some stocking reported.

The trade reports a better feeling in the market with prospects for the future looming up brighter. This is due primarily to the disposition on the part of West Virginia operators to hold their coal for higher quotations and not sacrifice it in Ohio markets. For the past few months there has been much cheap coal in Ohio and prices have been cut ruthlessly. But operators are now going slower and as a result a greater steadiness is noted on all sides.

The steam trade is still rather slow as manufacturing is improving very slowly. It is true that factories making war munitions have all they can do but other lines of manufacturing are slow. Buying off the open market still prevails. In many cases where contracts have been renewed a concession in price is required. Railroads are taking a fair amount of fuel.

In domestic lines there is not much activity noted. Some stocking of the fancy grades such as Pocahontas, splints and white ash is reported but the movement is not yet general. There is practically no stocking of Hocking, though some Pomeroy coal is being bought for stocking purposes. The retail trade is slow although prices are generally maintained at former levels. Dealers are not inclined to sell at low figures, being content to wait for better conditions. Retail stocks are only fair.

Lake trade is showing some increase although some of the large companies will not start shipments until after July 1. Docks in the Northwest are still congested and the interior movement is limited. Many operators are loath to invest money in Lake shipments without brighter prospects. Chartering of boats is not very active.

Mines have been working at about the following percentages of full capacity.

	Week Ended			
District	May 15	May 22	May 29	June 5
Hocking Valley...	25	25	30	30
Jackson....	25	25	20	20
Pomeroy Bend....	50	50	45	50
Crooksville.	25	30	35	35
Cambridge.	35	30	35	35
Massillon...	40	35	35	35
Eastern O.	..	5	15	25

Prices in the Ohio field are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump..............	$1.45	$1.50	.....
Inch and a quarter............	1.30	1.35	$1.30
Three-quarter inch............	1.25	1.30	1.25
Nut..........................	1.15	1.25	1.15
Mine-run...	1.05	1.10	1.05
Nut, pea and slack............	.70	.75	.65
Coarse slack..................	.60	.70	.55

CLEVELAND

Lack of Lake orders has curtailed the shipment of fine coal, but not sufficient to have a marked effect on current prices. Lake shipments falling behind.

Eastern Ohio mines are shipping a little coal into this market. Slack is selling at $1.50 to $1.55, mine-run at $1.85 to $1.90 and three-quarter at $1.95 to $2. These are current spot prices from local operators, and except on mine-run and three-quarter would not hold good for shipment. It would be impossible to place an order for five to ten cars a day of No. 8 fine coal at anything like these prices and probably such an order would be very hard to place as the operators have no outlet for their coarse coal.

The ruling prices on fine coal this week are $1.55 to $1.60. Youghiogheny operators have had Lake shipments curtailed and are holding their prices a little more firmly. Fairmont is comparatively easy.

Lake shipments fell off during May as compared with a year ago. Lake Superior shipments in May 1915 totaled 248,110 tons of anthracite and 1,248,447 tons of bituminous as compared with 248,694 tons of anthracite and 1,903,425 tons of bituminous last year. All of the larger shippers took very much less coal to June 1 than a year ago. A few of the shippers ran ahead of last year, but their docks are filled now and they are putting in stop orders.

In domestic coals there is plenty of smokeless mine-run, but a shortage of prepared sizes. The operators cannot take care of the fine coal. The Lakes are not furnishing the outlet this year and are not likely to until about Aug. 1.

Prices for shipments are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	W. Va. No. 8
Lump..........	$3.10	......	.....	....	......
Lump, $\frac{3}{4}$ in.....	.....	$2.20	$2.00	$1.85@1.90	$1.95
Egg...........	3.10	......	......	....	......
Mine run.......	2.65@2.70	2.10	1.85	1.80@1.85	1.85@1.90
Slack..........	......	1.65	1.60	1.60@1.65	1.50@1.55

CINCINNATI

Sluggishness in all quarters. Steam contracting has not improved.

Even smokeless coals are beginning to feel the depression despite the relatively small supply and the active demand which nearly always keeps these in first-class shape. The tendency toward economy among consumers has also had its effect upon smokeless coal and there is a disposition to substitute a cheaper coal. Splint is dragging, as are all other bituminous coals, simply because demand is lacking. The Lake movement is very sluggish. A better feeling in the steel industry, caused by the consumption of plants handling war orders, is the most encouraging feature of the current situation.

LOUISVILLE

Mines continue on short time and steam market is softer. Heavy river shipments.

The mines generally are running on short time and are expected to continue so until July, when it is hoped that the domestic stocking movement will increase the demand. The steam coal market is softer, due to the supplies of slack resulting from increased operations to supply the Lake trade. There is a considerable accumulation of steam sizes in the larger towns.

Sales of the last ten days have been on the basis of from $1.40 to $1.85 for block coals of best grades; $1.10 to $1.35 for egg coals; 60 to 75c. and 40 to 50c. for nut and slack, all prices f.o.b. mines.

Large tows of coal from Pittsburgh are reaching here on the Ohio River bound for New Orleans. The boats have had some trouble due to heavy fogs and have found it necessary to tie up over night on some occasions. The "Sprague," with 1,250,000 bu in 52 barges, has passed into the Mississippi River being attended by the harbor boat "Wash Gray."

BIRMINGHAM

Steam business improved. Many large contracts made. Lump coal shows some betterment. Operators optimistic.

With the closing of contracts aggregating over one million tons of steam coal during the past week, business in this district has taken a decided boost on this grade. While some of this tonnage is simply on a "re-contract" basis, about 100,000 tons of it is new business for the district, or at least these mines have not had it for over seven years.

Operators are planning to increase their tonnage, and improvements over the entire district are being made preparatory to doing a large business. New mines are being opened up, while those that have been closed are cleaning up and some have already resumed operations. Lump coal shows an improvement over last week, and if the volume of business during the balance of the month is on the same basis as the first five days, the tonnage will far surpass that of May. Prices, however, are remaining stationary, and no change is looked for, for some time. Blacksmith coal is in a satisfactory condition.

COKE

CONNELLSVILLE

Large inquiry suddenly appeared for second-half furnace coke. Higher prices expected shortly. Labor shortage anticipated after moderate increase in production.

Inquiry has suddenly appeared in volume for furnace coke for the second half of the year. There is definite inquiry for about 40,000 tons a month, and tentative inquiry for about half as much more. About two-thirds of the tonnage in prospect is for furnaces now idle but which are expected to get into blast by about July 1. There is no rush about getting idle furnaces in blast, the interest of furnacemen in the coke market being rather premature because there are signs that prices will advance after a little more coke has been disposed of. Production and shipments in the Connellsville region, about 315,000 tons at last report, show a gain of over 50% over the December average, and well posted men assert that the limit is 350,000 or possibly 375,000 tons, before a labor shortage is encountered. We quote furnace coke at $1.50 for spot, $1.60 for June and $1.75 for second half, and foundry at $2@2.40 for prompt and $2.20@2.40 for twelvemonth contracts, depending on grade, all per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended May 29 at 316,890 tons, an increase of 10,199 tons, and shipments at 315,523 tons, an increase of 10,476 tons.

Buffalo—The trade in coke has not changed of late and it could not well be more dull. Some of the more active coal salesmen are saying that the tone is better than it was, and they are looking for a material improvement shortly. Everybody is hopeful, but confidence is confined to the few. The price of coke remains on the basis of $4.15 for best 72-hr. Connellsville foundry and $3.15 for stock coke.

Chicago—The market on domestic sizes has been weak, but the foundry coke trade seems to be looking up somewhat. Prices have been steady for furnace and foundry use as follows: Byproduct, $4.55@4.75; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.65@3.75; furnace, $4.50@4.75.

St. Louis—There is considerable speculation as to the factor that the St. Louis Elkhorn Byproduct Coke Co. is going to be in the market. The $2,000,000 plant of the M. W. Warren Coke Co. at Carondelet has been completed and put in blast. The company is exploiting its product extensively and urging its cheapness, efficiency and smokelessness. The daily capacity of the plant is to be 750 tons.

MIDDLE WESTERN

GENERAL REVIEW

Sluggishness still prevails but the undertone is stronger. Screenings slightly easier. Anthracite still moving slowly.

General quietness still continues, although cooler weather has had the effect of stimulating increased orders for domestic sizes. The feeling prevails that the uncertainties of the past three months are about over and that an upturn has begun which will gain considerable headway by the end of the current month. There is more of a disposition on the part of retailers and manufacturing enterprises to take larger tonnages and some standing orders on the coarse sizes have been increased.

Screenings have been softer showing an average decline of 10c. per ton but this condition is only temporary, as several large producers have no fine coal to offer on the open market. One of the more important public service corporations has just recently made inquiries for prices covering screenings to be shipped during the next two weeks, which should have the effect of stiffening quotations. The railroads continue to give minimum weekly orders for current needs, but the Chicago, Burlington & Quincy R.R. placed a large storage order with the Franklin and Williamson County operators this week at $1.15 for lump and egg.

INDIANAPOLIS

The dull period of the year is at hand and market is unusually quiet. Better railroad consumption anticipated next month.

Prices are again about as low as they ever have been in this state. This is the season when they are at the bottom every year, but the prolonged restrictions of industrial and commercial activities have kept the demand unusually low. Keen competition adds further complications but the general tone of the market is steady. Screenings can still be sold at the relatively good price of 85 to 90c. and mine-run at $1.10 to $1.20, but prices are made under these. Some mines having screenings contracts to fill are making concessions on lump coal and vice versa.

The month of May was unusually cold in Indiana and the demand for domestic lump lasted much longer than usual, but June will be so warm that the consumption of domestic grades will be at the minimum. The coal industry will not feel the benefits from the increased railroad traffic caused by the marketing of wheat and oats until about the middle of July. The demand from factories is about at the same level.

ST. LOUIS

Price cutting has demoralized the market but there is a slightly heavier demand and the outlook is more encouraging.

Although the price-war continues among the Standard operators of the inner group and the cutting is reported to have been worse during the past week than at any time since the fight began, it is understood that new prices will be announced next week and a start made toward a return to normal. The quoted prices continue unchanged, 77½c. for 2-in. and 90c. for 6-in. on the Illinois Central and 77½c. for all sizes on the Louisville & Nashville, but some sales were made for 75c. on contracts of considerable size. It is reported that a few sales were made as low as 70c., but this is doubted. The Carterville operators have kept out of the trouble and are holding up their prices.

In spite of the demoralization resulting from this price war, there is a perceptible improvement in the general tone of the market. The demand was larger for all grades the last half of May than in the six weeks preceding, due to a gradual improvement in the industrial situation. The increase has not been great but it has been sufficient to encourage the operators and dealers.

CHICAGO

Mining operations continue much restricted. Prices are not satisfactory, particularly on Kentucky grades.

Franklin County operations have been averaging a little over two days' working time per week. Screenings have been stronger from this district and have been selling as high as $1.10 per ton. Colder weather caused an increase of orders for domestic sizes, but this demand was only of a temporary nature. The Williamson County operators are in the same condition as their neighbors, and are closing down the mines or diverting their tonnage entirely to the steam trade. The producers in Franklin and Williamson County fields are still adhering closely to their organized effort to maintain prices notwithstanding market demands do not improve as fast as anticipated.

There is no demand for domestic sizes from the Harrisburg district, but screenings and steam lump for railroad use have shown increased activity.

The market for Springfield coal has been without any appreciable change during the last week. Screenings from this district have been slightly softer.

The Indiana situation has not undergone any marked change recently. The demand still continues at a low stage, and it is noticeable that shipments are now falling behind last year. Dealers are contracting for very little tonnage, and the building trade strikes in Chicago have helped to reduce shipments.

Prices on Kentucky grades are uneven, and mostly at an extremely low level. A few cars of consignment coal have again been sacrificed at disturbing prices. Demurrage coal is sold as much as 60c. per ton below list prices.

Anthracite trade is very dull, and few orders have been thus far placed for June shipment. It is evident that anthracite buying in the West this year is going to be delayed until mid-summer or later.

RATE DECISIONS

I. C. C. Nos. 6381, 6504, 6570, 6573, 6603, 6615, 6616, 6624, 6631, 6765, 6874. Lake line applications under Panama Canal Act.

Upon applications of certain railroads under the Panama Canal act for an extension of time during which their interest in the operation of certain boat lines plying on the Great Lakes might be continued; **Held:**

1. That the physical fact of ports of call being served in common by the boats and the paralleling rails of the owning railroad establishes a case of competition existing between the owning railroad and its boat line.

2. That the case is the same where the railroad entity which owns the boat line also owns, through stock control, another railroad entity, or is an integral part of a system of railroad whose paralleling rails serve ports of call in common with the boats.

3. That where an owning railroad is a party to through all-rail routes or a member of "fast freight lines" or an association of railroads owning boat lines whose function is to keep the operation of their boat lines from interfering with the rail operations, the interest it thus maintains in common with the rail carriers whose rails do compete with its boat line is such an interest as the act provides against, and that it is possible for such an owning railroad to compete with its boat line for traffic, within the meaning of the act.

4. That the purpose of the Panama Canal act was to preserve to the common interest of the people, free and unfettered, the "water roadbed" via the Panama Canal. Also to restore all the water routes of the country to the same condition of freedom from domination that would reduce their usefulness as a natural means of transportation.

5. That Congress has decreed that there shall be a restoration of conditions which prevailed when railroads had no interest in and exercised no control over the boat lines plying upon the country's water routes. The inquiry in these cases is, Is the joint operation of these boat lines such as to make of them an exception?

6. That upon the respective records herein concerned, none of the several existing specified services by water is being operated in the interest of the public or is of advantage to the convenience or commerce of the people within the meaning of the act, and that an extension of the respective interests of the petitioners therein will prevent, exclude, and reduce competition on the great lakes. The application of each of the petitioners herein is therefore denied, effective Dec. 1, 1915.

FOREIGN MARKETS

GREAT BRITAIN

Market quiet. Italian business stimulates the trade. Great uncertainty prevails regarding licenses for export shipments.

There is at present a rather quiet tone in most markets, owing to various causes, including the decline in demand for house descriptions, holiday influences, and the restrictive effects of the export regulations. The intervention of Italy in the war has afforded some stimulus in certain quarters, for the license order will no longer apply to Italian shipments, and her requirements are well known to be large. In other directions the effects of the export order have been distinctly weakening to the market. The principle on which the licenses are granted is no nearer being known than at the outset, and is the subject of much criticism. A good deal of confusion arises from the fact that licenses are granted very readily in some instances, while in others, although the coal may be of the same quality and for substantially the same destination, permission to ship is refused. The awkwardness of the situation is self-evident.—"The Iron and Coal Trades Review."

May 28—There is a good demand but supplies are scarce and prices are rising. Quotations are approximately as follows:

Best Welsh steam.......	Nominal	Best Monmouthshires....	$7.92@8.04
Best seconds...........	Nominal	Seconds................	7.80@7.92
Seconds................	$8.40@8.64	Best Cardiff smalls.....	5.16@5.40
Best dry coals.........	8.40@8.88	Cargo smalls...........	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Outward chartering is more active but restricted by the difficulty in obtaining adequate coal supplies. Rates are approximately as follows:

Gibraltar.........	$4.08	Naples	$7.56	St. Vincent.......	$4.56
Marseilles........	4.83	Alexandria.......	6.00	Rio de Janeiro....	6.60
Algiers...........	3.81	Port Said........	5.28	Monte Video.....	6.00
Genoa............	7.44	Las Palmas......	4.32	River Plate......	6.24

Note—These quotations are based on an exchange rate of 24c. to one shilling.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 18.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
541	Dept. of Public Wks.	Toronto	Ont.		1004
689	H. W. Caldwell & Son Co.	Chicago,	Ill.	250[2]b	877

* Cents per 1,000,000 B.t.u. †Bids indicated thus have been recommended to be accepted.

+No. 678—New Brunswick, N. J.—Bids on this contract (p. 876), which provides for furnishing the local Board of Education with its coal requirements during the ensuing year, were received until 8 p.m. June 4. Bids were requested on 300 tons of egg coal, 100 tons of stove, 200 tons of pea or buckwheat and 300 tons of bituminous. Address William H. Benedict, Supply Committee, Bd. of Edu., New Brunswick, N. J.

+No. 693—Madison, Wis.—About 40 separate proposals from 17 different coal companies have been submitted on this contract (p. 877), which provides for furnishing the University with its fuel requirements during the ensuing year. Tests of the various coals are now being conducted, and if these prove satisfactory, the contract will be awarded to D. E. McMillan & Bros., of Chicago. The tonnage involved aggregates 4000 tons of Nos. 2 and 3 screened coal at $2.70 per ton and 1600 tons of ¾-in. screenings at $2.20 per ton. Address Bus. Mgr. H. J. Thorrkelson, University of Wisconsin, Madison, Wis.

+No. 706—New York—Bids on this contract (pp. 877, 915, 955, 1004), were reopened at noon, June 11. There were nearly 25 changes made in the original tonnages of the first specifications, aggregating 8834 tons. The total number of tons bid on was 233,359 instead of 242,193. The principal changes were: Zone 1—2236 tons of egg coal instead of 3038 tons. Zone 3—1041 tons of egg instead of 1191 tons; 390 tons of broken instead of 500 tons, and 285 tons of buckwheat No. 2 instead of 450 tons. Zone 5—12,000 tons of buckwheat No. 3 instead of 11,100 tons. Zone 18—1390 tons of stove instead of 1290 and 1760 tons of pea instead of 1560 tons. Zone 20—2100 tons of mine-run instead of 2900 tons. Address Secy. F. R. Leach, Central Purchasing Committee, Room 1126 Municipal Bldg., New York City.

+No. 720—Baltimore, Md.—This contract (p. 916), which provides for furnishing the local Lighthouse Inspector with coal during the fiscal year ending June 30, 1916, has been recommended for award as follows: Nottingham & Wrenn, Inc., item 1, $885; item 2, $1180; item 8, $3100; item 10, $758; total, $5923. Norfolk Coal & Ice Co., item 3, $110.50; item 7, $1120; total, $1230.50. Henry T. Hidden, item 4, $1982.50; item 5, $464.10; total, $2446.60. O. W. Guy Co., item 6, $8505. B. Nicoll & Co., item 9. $7504. The gross amount involved in the contract is $25,609.10. Address Lighthouse Inspector, Baltimore, Md.

+No. 752—Washington, D. C.—Bids on this contract (p. 917), which provides for furnishing the United States with coke under Schedule 8287, were as follows:

Tons..........	100		250	4000[1]	120	500	1000	800	450[2]

[1] Bushels. [2] Cupola coal. [3] Also $4 05. [4] Also $7.50.

Address Paymaster-Gen. of the Navy Samuel McGowan, Washington, D. C.

+No. 753—Irvington, N. J.—All of the five bids submitted on this contract (p. 917), which provides for furnishing the local schools with coal, were exactly the same, being $6 per ton for stove and $4.40 for pea. Address Secy. William A. Sherman, Board of Education, Irvington, N. J.

New Business

+No. 816—Steubenville, Ohio—Sealed bids will be received until noon June 14 for furnishing the local Water-Works Department with coal during the fiscal year beginning on that day. The coal must be clean and free from slate, and price quoted should be f.o.b. Alikanna Station, on the Cleveland & Pittsburgh R.R. All bids must be accompanied by a certified check for $200. Address Dir. of Pub. Service James P. Garvin, Steubenville, Ohio.

No. 817—Chicago, Ill.—The Barrett Varnish Co. will be in the market about July 15 for three cars of Pocahontas mine-run. Address Purchasing Agent, Barrett Varnish Co., Chicago, Ill.

+No. 818—Moline, Ill.—The Board of Education at this place will contract some time in July for about 2500 tons of lump coal. The business is let on competitive bids, and the present contract is being filled at $3.40 per ton. Address Chn. Supply Com. H. S. Bennett, Reliance Bldg., Moline, Ill.

+No. 819—Austin, Tex.—Sealed bids will be received until 10 a.m. June 21 for furnishing the state charitable institutions with a three to twelve months' supply of coal beginning Sept. 1. Address State Pur. Agt. George Leavy, Austin, Tex.

+No. 820—Indianapolis, Ind.—The State Government will receive sealed bids until 11 a.m., June 12, for furnishing the State House with coal during the ensuing year. Specifications can be inspected on application. Address State Engineer, State House, Indianapolis, Ind.

+No. 821—Cranston, R. I.—The Board of Contract and Purchase will receive bids until 8:15 p.m., June 14, for furnishing approximately 1000 tons of coal required by the various city departments. Complete details and specifications may be obtained on application. Address Clk. Daniel D. Waterman, Bd. of Contract and Purchase, City Hall, Cranston, R. I.

+No. 822—Providence, R. I.—Sealed proposals will be received until 2:15 p.m., June 14, for furnishing the coal requirements of the various city departments. Complete details, including specifications may be obtained on application. Address Clk. Wm. C. Pelkey, City Hall, Providence, R. I.

+No. 823—Toronto, Can.—Sealed proposals will be received by the Canadian Government until June 12 for supplying the coal requirements at the Government buildings at Brockville, Cobourg, Hamilton, Kingston, London, Uimico, Penetanguishene, Toronto, Whitley Hospital for the Insane, the Orillia Hospital for Feeble Minded, Woodstock Hospital for Epileptics, Mercer Reformatory, Toronto, Ontario Reformatory, Guelph, and Provincial Brick Plant, Uimico. Complete specifications may be had on application to the bursars of the respective institutions, or address the Provincial Secretary, Parliament Bldg., Toronto, Can.

No. 824—Detroit, Mich.—The Board of Health will receive sealed proposals until June 12 for furnishing anthracite, egg, stove, and chestnut coal to the Tuberculosis Pavilion, Herman Kiefer Hospital, and such quantities of bituminous coal at the Administration Building, and the Board of Health Building as may be required during the fiscal year ending June 30, 1916. Address Secy. John F. McKinlay, Bd. of Health, 223 St. Antoine St., Detroit, Mich.

+No. 825—West Newton, Mass.—Sealed proposals will be received until 2:30 p.m., June 14, for furnishing the coal required by the School, Street, Fire, Police, Charity and Library Departments of the city. Proposals may cover the entire supply, or be only for certain wards. All bids must be accompanied by a certified check for $200, and a bond for $2000 will be required. Bids must be submitted on forms which can be obtained on application. Address Pub. Bldg. Comr. Walter R. Forbush, City Hall, West Newton, Mass.

+No. 826—Detroit, Mich.—The fire commission at this place will receive bids until 2:30 p.m., June 14, for furnishing their coal requirements during the fiscal year beginning June 30. Specifications are on file at the office of the Secretary. Address Secy. George J. Finn, Detroit Fire Dept., Detroit, Mich.

No. 827—Winnipeg, Manitoba, Can.—The Winnipeg Electric Ry. Co. will receive bids until noon, June 17, for supplying the company's fuel requirements during the ensuing year. Complete details may be had on application. Address Purchasing Agent, Winnipeg Electric Ry. Co., Winnipeg, Manitoba, Can.

+No. 828—Grand Forks, N. D.—Sealed bids will be received at the University of North Dakota for furnishing approximately 3000 tons of Youghiogheny, Hocking, Illinois or other screenings during the fiscal year, beginning July 1. Bids will be received until 10 a.m., June 12, and should be submitted on both the B.t.u. and the per ton basis. Specifications and proposal forms may be had on application. A certified check for $350 must accompany each proposal. Address Secy. J. W. Wilkerson, University of North Dakota, Grand Forks, N. D.

+No. 829—Ann Arbor, Mich.—Bids will be received by the University of Michigan until noon, June 17, for furnishing approximately 18,500 tons of coal to be delivered during the year, beginning July 1. Complete specifications may be obtained on application. Address Secy. Shirley W. Smith, University of Michigan, Ann Arbor, Mich.

No. 830—Lebanon, Ind.—The common council will receive bids up to 7:30 p.m., June 14, for furnishing coal for the Lebanon waterworks for one year. Address City Clk. Wm. F. Smith, Lebanon, Ind.

+No. 831—Portsmouth, Ohio—The Board of Education here will receive bids until noon, June 23, for furnishing coal approximately as follows: Smokeless or Pocahontas, 260 tons; mine-run, 1100 tons; lump, 20 tons. Bids are to cover cost of delivery to the several school buildings, delivery to be completed by Aug. 14. All bids must be accompanied by a certified check for 10% of the amount of the bid, and the successful bidder must give a bond of 50% of the amount of the contract. Address Clk. William C. Hazlebeck, Bd. of Edu., Portsmouth, Ohio.

+No. 832—Johnstown, Penn.—Bids will be received some time in July for furnishing the local Board of Education with approximately 3000 tons of the best quality mine-run coal, deliveries to be made as ordered by the janitor. On last year's contract, the First and Second Districts were supplied at $1.38 per ton and the Third District at $1.53. The call for bids is advertised. Address Secretary, Board of Directors, 601 Swank Bldg., Johnstown, Penn.

+No. 833—Jasper, Ind.—The Light and Water Department at this place will be in the market some time in July for 1800 tons of bituminous coal, which is usually bought at $1.70 per ton delivered in the bins. The business is let on competitive bids. Address Supt. Joseph P. Kunkel, Jasper Electric Light & Water-Works, Jasper, Ind.

+No. 834—Albany, N. Y.—Bids will be received until 10 a.m., June 14, for furnishing the State Armory with 225 tons of egg and 5 tons of chestnut coal. Address County Treas. Isaac La Grange, Albany, N. Y.

+No. 835—Muskegon, Mich.—The Board of Education will be in the market some time in July for approximately 3000 tons of various grades of coal. The call for bids is advertised and the business usually let to local dealers. Address Board of Education, Muskegon, Mich.

+No. 836—Trenton, N. J.—The State Board of Education will receive bids until 10:30 a.m., June 12, for furnishing coal as follows: 250 tons buckwheat, 10 tons pea, 150 tons egg, 50 tons stove, 10 tons bituminous. Specifications may be obtained on application. Address Department of Public Instruction, State Board of Education, Trenton, N. J.

No. 837—Fulton, Mo.—The Water, Light and Power Plant at this place will be in the market some time during July for approximately 4000 tons of bituminous coal. The business is let on a competitive basis and is usually concluded at $2.60 per ton. Address Supt. W. J. McCarrel, Municipal Water, Light & Power Plant, Fulton, Mo.

+No. 838—Joplin, Mo.—The Board of Education here will be in the market probably in July for 1000 to 1200 tons of a good grade of lump coal. The coal has usually been bought in the past from mining companies in carload lots, but will probably be purchased from local dealers during this year. From $2.90 to $3 per ton is the ruling price. The call for bids is advertised. Address Secretary, Board of Education, 301 Miners Bank Bldg., Joplin, Mo.

+No. 839—Hoboken, N. J.—The Board of Education received bids until 8 p.m., June 7, for furnishing about 5000 tons of egg, nut, stove and pea coal each. Referring to the announcement in our contract No. 676 (Vol. 7, p. 876) to the effect that all the future requirements of Hoboken would be purchased through a central committee, it appears that the commissioners who determined upon this course have exceeded their authority under the Walsh act, and that school contracts may not be included in this. Address Business Mgr. R. A. Marnell, Bd. of Edu., Hoboken, N. J.

+No. 840—Newark, N. J.—The Board of Education at this place will receive bids until 3:15 p.m., June 17, for furnishing coal requirements during the ensuing year. Specifications may be had on application. Address Secy. R. D. Argue, Dept. of Supplies, Third Floor, City Hall, Newark, N. J.

+No. 841—Chester, Penn.—The City Property Committee at this place will be in the market some time in July for approximately 1200 tons of Lehigh coal. The call for bids is advertised and the contract made usually at about $6.20 per ton. Address Chn. of Property Com. W. L. Booth, 1013 Edgmont Ave., Chester, Penn.

+No. 842—Columbus, Ga.—Bids will be received until June 15 to furnish 400 tons of coal suitable for use in school furnaces, f.o.b. cars Columbus, Ga.; 300 tons are to be delivered before Sept. 1 and 100 tons to be delivered during the month of January, 1916. Prices are desired on both mine-run and nut coal. Address Supt. R. B. Daniel, Public Schools, Columbus, Ga.

+No. 843—Columbus, Ohio—Sealed bids will be received until June 23 for furnishing and delivering coal to the Court House, Memorial Building, County Morgue and County Infirmary as may be directed. All of the coal is to be mine-run. The estimated amounts required are: Court House, 1200 tons; County Infirmary, 4000 tons; Memorial Building, 200 tons, and County Morgue, 15 tons. All coal for the County Infirmary is to be delivered on the infirmary switch of the Norfolk & Western in not less than carload lots. The County Commissioners reserve the right to reject any or all bids. Address Clk. John Scott, of the Bd. of County Comrs., Columbus, Ohio.

+No. 844—Lexington, Ky.—The Board of Education at this place will be in the market some time during the next month for its annual requirements of coal, amounting to about 1000 tons. Screened lump coal is mostly used, and the price made is about $2.90 per ton, delivered to the schools as required.

The call for bids is advertised. Address Board of Education, Lexington, Ky.

+No. 845—Washington, D. C.—Sealed bids will be received until noon, June 22, for furnishing 300 gross tons of bituminous splint coal to be delivered in carload lots, f.o.b., Navy Aëronautic Station, at such times as may be required during the fiscal year ending June 30. Address Navy Dept., Bureau of Supplies and Accounts, Washington, D. C.

No. 846—Camden, Ark.—The Arkansas Light & Power Co. at this place usually contracts during July for its annual requirements of coal, amounting to 230 tons of Arkansas slack. The coal is usually bought at $2.40 f.o.b. Camden. Address Purchasing Agent, Arkansas Light & Power Co., Camden, Ark.

+No. 847—Monessen, Penn.—The School Board at this place will receive bids until June 15 for furnishing and delivering a good grade of mine-run coal to the various school buildings. Address Secy. C. H. Dills, Bd. of Edu., Monessen, Penn.

+No. 848—Chicago, Ill.—The Board of Education will receive bids until noon, June 16, for furnishing and delivering coal to the various schools and other buildings of the department during the school year ending June 30, 1916. All proposals must be accompanied by a certified check for $200. Separate proposals are solicited for the new John Worthy School, which it is estimated will require 750 tons of bituminous lump. About 131,025 tons of bituminous coal of various grades and sizes will be required, and 3361 tons of anthracite. The estimated requirements of the various districts are given in the accompanying table, and the limits of the districts are shown on the map herewith. The map, however, does not show the newly annexed Town of Clearing, in which it is estimated that 120 tons of smokeless mine-run will be required. Address Secy. L. E. Larson, Bd. of Edu., Tribune Bldg., Chicago, Ill.

[1] Smokeless mine-run.

+No. 849—Dorchester Center, Mass.—The State Hospital Trustees received bids until 10:30 a.m., June 11, for furnishing 275 tons of anthracite coal. Address Henry Lafavour, Finance Com., Boston State Hospital Commission, Dorchester Center, Mass.

Contracts Awarded

+No. 130—Lansing, Mich.—This contract (p. 357), which provides for furnishing the Local Board of Education with about 1700 tons of Pocahontas mine-run coal, has been awarded to the **Lansing Artificial Stone Co.**, at $3.70 per ton. This price is three cents per ton under that of the old contract. Address Secy. Sylvia L. Hunter, Supply Com., City Hall, Lansing, Mich.

+No. 442—Minot, N. D.—This contract (p. 672), which provides for furnishing Ward County with coal during the ensuing year, has been awarded to **L. D. Colton**, at $2.30 per ton for lignite coal. Address County Audr. L. J. Thompson, Minot, N. D.

+No. 531—Frankfort, Ky.—This contract (pp. 357, 748), which provides for furnishing the State Prison and the School of Reform with about 19,000 tons of coal, has been awarded to the **Stearns Coal & Lumber Co.** The contract for the State Reformatory covering 12,000 tons was let at $1.98 per ton, or 2c. less than the old contract, and the contract for the Reformatory covering 7000 tons was let at $2.08 per ton, or 12c. less than the original contract. Because of the uncertainty regarding the decision of the Interstate Commerce Commission on freight rates, West Virginia operators were eliminated from consideration in the contract. Address State Prison Commission, Frankfort, Ky.

+No. 588—Everett, Mass.—This contract (pp. 749, 918), which provides for furnishing the local Board of Education with its coal requirements has been awarded as follows: **J. E. Lewis & Co.**, egg, stove and nut, $6.38; New River bituminous, $4.63. **Metropolitan Coal Co.**, screenings, $3.65. Address Chn. of Com. on Fuel Charles Manser, High School Bldg., Everett, Mass.

+No. 597—Columbus, Ohio—This contract (p. 794), which provides for furnishing the local Board of Education with coal during the ensuing year, has been awarded as follows: **Franklin Builders Supply Co.**, 8000 tons of Hocking two-in. lump, $2.34. **Homer C. Gill**, 500 tons of Pocahontas lump, $3.07½. All bids for the Crestview school building were rejected, and the board given authority to purchase the supply for this building wherever it desires. Address Chn. Bd. of Edu. E. B. McFaddin, Columbus, Ohio.

+No. 659—Philadelphia, Penn.—This contract (p. 836), which provides for furnishing the local Lighthouse Department with coal requirements during the fiscal year, June 30, has been awarded to **J. H. Weaver & Co.**, at $2.65 per ton. The Pennsylvania Coal & Coke Corp. bid $2.60; J. Tatnall Lea & Co., $2.74; Coale & Co., $2.74 and $2.89. Charles Warner Co. was awarded the contract for the light stations and tenders at $5.90 for stove coal, and $6.05 for nut. Address Lighthouse Inspector, Philadelphia, Penn.

No. 813—Boston, Mass.—This contract (p. 1006), which provides for furnishing the Stone & Webster Co. with 15,000 tons of New River or Pocahontas mine-run coal for shipment at one of the lower Lake ports, has been awarded to the **New England Coal & Coke Co.** Address Purch. Agt. R. E. Hamilton, Stone & Webster Co., 147 Milk St., Boston, Mass.

Contract Notes

New Orleans, La.—The **Tennessee Coal & Iron Co.** and the **R. B. Hyams Coal Co.**, of New Orleans, were lowest bidders on the United States plant coal contract, at the Naval Station, Algiers, La., and Burwood, La. The bids have been forwarded to the Chief of Engineers, Washington, D. C. This contract has attracted considerable attention since Mar. 29, and every company in New Orleans was competing on it.

Olympia, Wash.—The **Durham Colleries Co.**, of Tacoma, has been awarded the contract for 2000 long tons of coal to be furnished the Western Washington Hospital for Insane at a price of $3.18 per ton. This supply is expected to last six months.

Italy—A business man in Italy informs an American consular officer that he desires to receive quotations from dealers in bunker coal.

+Kearney, N. J.—The Board of Education here awarded the contract for its fuel supply during the ensuing year to the **S. Smith Coal Co.** The contract includes 200 tons of anthracite stove, 240 tons of egg and 275 tons of nut. The price quoted was $5.85 per ton for delivery previous to July, and $6.30 per ton for delivery from then until April, 1916.

+Elmira, N. Y.—On the bids for furnishing the county with coal during the coming year, B. Yenger was the lowest at $5.75 per ton previous to September, and $6 thereafter. Over 17 bids were received on the contract.

Spain—A business man in Spain informs an American consular officer that he desires to represent American exporters of coal. Correspondence may be in English.

Wilmington, Del.—The **Pennsylvania Coal & Coke Corp.** has been awarded the contract for supplying the Lighthouse Tender (Iris) with coal at $2.60 per ton. J. Tatnall Lea & Co. bid $2.75 and $2.64, and Charles Warner Co. bid $3.05.

Duluth, Minn.—The City Government at this place has rejected all bids submitted for furnishing their coal requirements during the year beginning July 1, on the ground that inferior coal is always supplied on the contract. The Pittsburgh Coal Co. bid $12,500 on approximately 3000 tons. The city believes that they pay as much on a contract as they would by purchasing in the open market, and under the latter condition they would be able to get considerable competition from local dealers.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

WHEN Columbus discovered America, he found an uncultivated, unprofitable sweep of country inhabited by savages and animals. He went back to Europe and **advertised** the new country—and now look at us!

If a product is advertised successfully continuously, it's a good product.

WM. BUXMAN, the Brooklyn orator, in an address to the Engineers' Club of Philadelphia, the other day, said a few things that belong on this page.

"Not so long ago, well within my time, a subscription solicitor would go to you—the prospective reader—and would explain that you should read this technical paper because it treated on subjects in your field—you would pick it up, give one look through it and explain that you didn't care for it because it had too much advertising in it.

"But this order of things has changed—naturally—because of the great change in technical paper advertising itself.

"Where in the old days an advertiser enshrouded his proposition in mystery for fear his competitors would find out things, today you find the manufacturer telling you the whole inside story of his goods—taking you by means of the printed form throughout his work rooms—to the plants to which his product has been sold—to the man who is using his goods.

"He shows you exactly why his goods should be used—how they are made—what the plans back of the product are—who has purchased his goods—what results are being secured—where they can be seen.

"He is, in other words, laying his cards on the table—giving you no opportunity to say later, in defense of poor showings, that you were unaware that such and such a machine could accomplish such and such results."

Read the ads—it makes you a wiser, better, safer buyer.

GUS M. HODGES, Ass't. Gen. Mgr., Alba Malakoff Lignite Co., of Alba, Texas, writes:—"I like Coal Age—in fact it can't be beat. The reading is of the best and when I am needing supplies of any kind, I always look at Coal Age advertisements first."

COAL AGE

Vol. 7 NEW YORK, JUNE 19, 1915 No. 25

Shipping Unneeded Coal to a Glutted Market

> OPERATORS *ship coal to a glutted market on consignment and then notify some broker to sell it for the best price obtainable. Or the operator will consign it to himself and then send an agent to sell it for all he can get out of it. No wonder the coal market is demoralized*

Suppose the stock of flour in your commissary is getting low, and Brown, who is a broker for the Gem Milling Co., calls you up and tells you that he has ten carloads of flour on track in the railroad yards. The market price of $7 per barrel that Smith was holding out for would look mighty large under these circumstances. You would go to Brown and tell him that, in order to help him out of a bad hole, you might be willing to take a car for about $5 per barrel, and right off you would call up some of your friends and tell them of the great opportunity that had come your way.

At the next meeting of the directors of your bank, the Gem Milling Co.'s application for a loan would not impress you favorably. You wouldn't care to lend them money just at present, and to support your contention that they shouldn't be allowed any credit, you would tell your fellow-directors very solemnly that this milling company is not exercising much business sagacity or it would not be guilty of such a reprehensible practice as sending ten carloads of flour, for which it had absolutely no orders, to its agent to dispose of as best he could and for the best price obtainable.

However, the other directors still have faith in the milling company and they know that it simply had to raise a little money to pay its employees and to settle for the grain which it has purchased and merely took this means of raising the money quickly. And so, to tide it through another tight season, the directors decide to make it a loan, and you acquiesce.

Now, when you attend the meeting of the stockholders of the Coaltown Wholesale Grocery Co., the president of that concern makes a glowing report of the prospects for the coming year's business and mentions incidentally that he has concluded a deal that will show handsome profits for his supply house. He has bought ten carloads of flour from the Gem Milling Co. at $5 per barrel and in addition the milling company has prepaid the freight.

Then the president states confidentially that "we will not have to pay these bills for sixty days and we can make them wait a little longer than that by making the millers a payment on account, and then sixty days later we can pay the balance." In the meantime, flour will go up, and the grocery company will reap the benefit of increased prices which should have gone to the milling company.

While the president is reciting the story of his sagacity, you are doing some serious thinking. It is our opinion that when the bank directors meet in their next monthly conference or before that time you will certainly notify your fellow-directors that you cannot approve of any further loans to the Gem Milling Co. until it revises its methods of doing business and gets down financially to brass tacks.

So why as a coal operator do you ship coal to market for which you have no orders and wait a month to six months for your money, and perhaps even carry along the freight charges on the shipment also.

A Western Preparation Plant

By R. G. Miller*

SYNOPSIS—On account of competition among producers, as well as the exacting demands of the trade, careful preparation of coal is necessary. This article describes how old and inadequate equipment was replaced with new and efficient apparatus without making any considerable changes in the tipple building.

The preparation of coal is a subject on which much more thought should be expended than has been the case in the past. Considering the vastness of the bituminous-coal industry in this country, relatively little intelligent consideration, until recently, has been given its preparation, and we are therefore behind European practice, although over there producers are handicapped by coal of a poorer average quality and thin veins and are required to exercise more care and labor in preparing their product for market.

The average American coal is of better quality than that produced in foreign lands (Welsh coal excepted) and has therefore received less attention in preparation. Keener competition among producers in our bituminous fields is forcing closer attention to preparation, as this determines more and more its salability and is a factor in establishing and retaining trade.

Prior to 1897 most bituminous mines in this country were equipped only with the well-known bar screens which still survive in many tipples. At that time most operators had only three sizes of coal to market—lump, screenings and mine-run.

When the methods of mining changed, larger percentages of the smaller sizes were made. About the same time the basis of paying the miner also changed. This no longer made it an advantage for him to exercise care in digging the coal, for he received as much for mining the finer sizes as he did if he was careful and produced a larger percentage of coarser fuel.

The changed conditions compelled operators to adopt better methods of preparation, and many installed the inclined type of shaker, it being then the best screen available.

The next tendency was to increase the number of sizes made, and this has grown until such a chaotic condition exists, owing to the multiplicity of sizes of coal produced at various mines, that operators are now making an effort to minimize the number of sizes made and standardize these sizes throughout the bituminous fields.

In addition to shaker screens, at mines where the coal contains foreign matter in such quantities that it is necessary to remove it, apron picking tables were installed. Furthermore, in plants where care in handling the coarser sizes was advantageous, loading booms of the chain and apron type were adopted. Therefore in a screening plant where it was necessary to size, pick and carefully load the coal in railroad cars, a heavy structure was required in order to support shaker screens, picking tables and loading booms.

A marked improvement in equipment and a much simpler arrangement for screening, picking and carefully loading coal after it has left the dump or the weigh pan began in 1912, when there was introduced into this country by the Roberts & Schaefer Co., of Chicago, a horizontal combination screen and picking table, known as the "Marcus," which is fast gaining favor over the old-style inclined oscillating screen. This combination screen and picking table had previously gained marked success abroad.

This company also recently invented a loading boom of the shaking type, which is simple in construction and operation and handles the coarser sizes of coal with almost no breakage, and has obvious advantages over the chain-and-apron type of loading boom.

Coal operators from Colorado on the west to Pennsylvania and West Virginia on the east were quick to recognize the benefits to be derived from the use of these modern devices and are adopting them to meet their special requirements. This adoption is easy on account of the flexibility which this equipment possesses, both as to installation and operation.

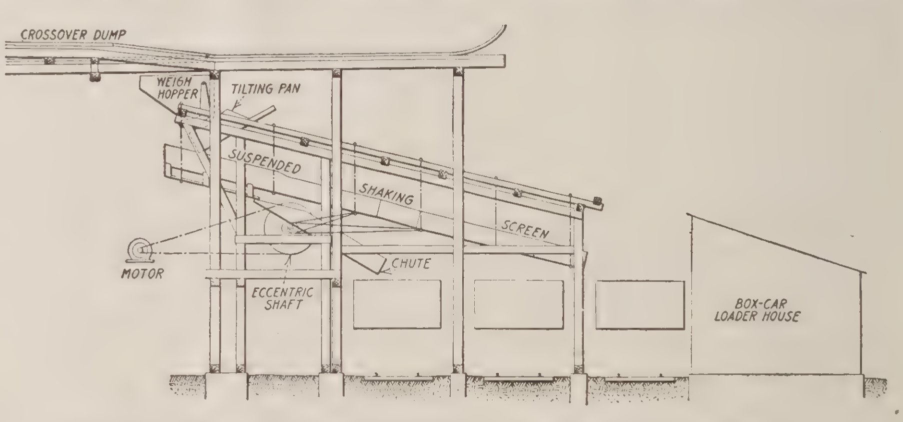

Fig. 1. General Arrangement of the Original Tipple

The plant recently completed at Oak Creek, Colo., for the Moffat Coal Co., is a notable example of an installation in an old tipple from which inclined shaker screens were removed and the Marcus horizontal screen and picking table installed.

The following description should be of special interest to operators who have similar problems to solve:

Fig. 1 shows this tipple with inclined shaker screens as it existed until Apr. 19, 1915, at which time these screens were removed and replaced by a horizontal Marcus patent picking table screen, which on May 3, two weeks later, was in operation, handling a capacity of 2500 tons per day.

Fig. 2 shows the same tipple with the new installation. Coal is dumped from mine cars into the weigh-hopper and weighed, and is then turned into the feeder hopper, from which it is uniformly delivered by a reciprocating feeder to the Marcus screen, over which it passes, and where it is thoroughly screened and picked. The rear end of the screen has four decks. The top deck has bar screens with 6-in. spaces, which were adopted primarily for the purpose of preparing railroad coal.

---

*Assistant engineer, Roberts & Schaefer Co., Chicago, Ill.

When making this variety of fuel, everything going through the bars passes through the gates *A*, *B* and *C* and is delivered to railroad cars on track No. 4, through the chute *L*. When making this railroad coal the lump coal proceeds on the top deck and is thoroughly picked and then delivered either to box cars through gate *H* and chute *O* or passes to gondola cars over the curved lump chute *I*, which it will be noted is provided with loading fingers for trimming the car.

The foreign matter picked from the coal is carried forward in the refuse trough and delivered to the refuse bin, from which it is removed by a small car. This refuse bin stands far enough up the track to make room for a box-car loader, which is on the center line of the screen, while the refuse comes to the bin over a small steel-lined wooden chute. The refuse trough is directly over the center line of the Marcus screen and is operated by the same motion.

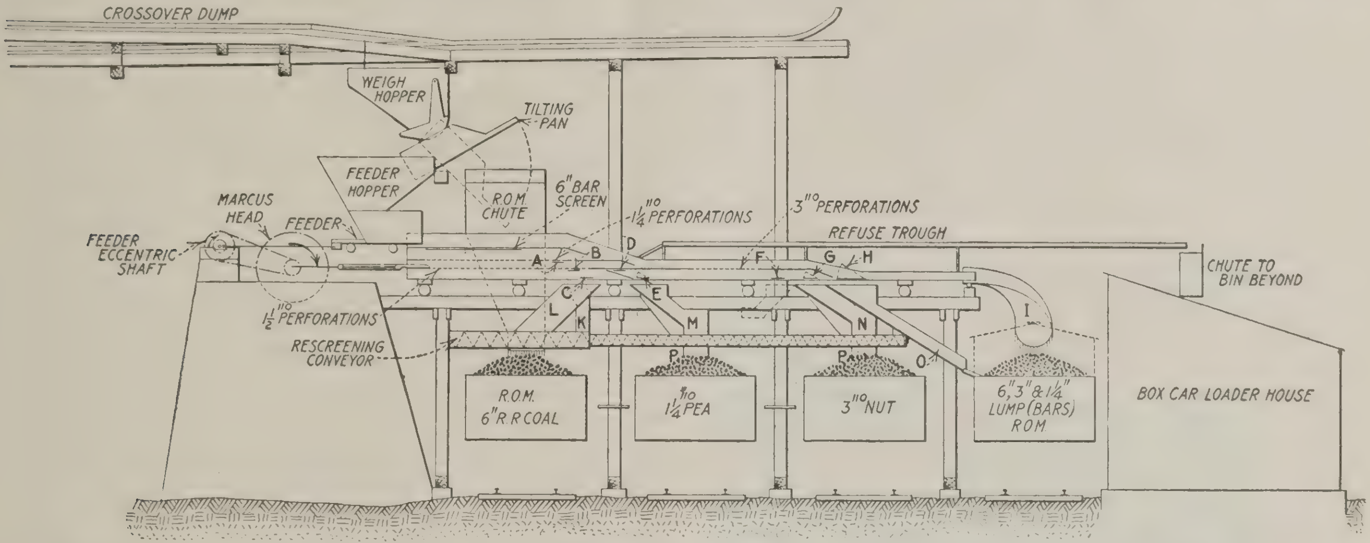

Fig. 2. Arrangement of the Tipple and Preparation Plant after Installation of New Machinery

If at any time it is desired not to run any of the tipple machinery, run-of-mine coal can be diverted to the run-of-mine chute by a tilting pan just below the weigh hopper, thereby loading straight mine-run coal on track No. 4.

However, hand-picked run-of-mine can be prepared by closing all gates, except gate *D* on the screen. In operating the plant in this manner, it will be observed that all coal below 1¼ in. is removed and travels along the bottom deck. This novel feature enables the pickers to see the foreign matter in the larger sizes and remove it effectively and economically.

After the larger sizes are carefully picked they unite with the fines on the bottom deck and pass over the curved lump chute *I* and are loaded into gondolas on track No. 1 as hand-picked run-of-mine. If it is desired to load this into box cars, then gate *H* is opened and the hand-picked run-of-mine passes over chute *O* and into the box car. It is possible, however, to remove ½-in. dust from this hand-picked run-of-mine by opening gate *C*. This is another unique feature of the Marcus which thereby provides a most excellent grade of run-of-mine coal.

When the plant is making screened coal, the dust passes through the ½-in. perforations on the second deck through gate *C* and a door in chute *L* to the rescreening screw conveyor through chute *K*.

It is interesting to note the method of rescreening the sized coal after it leaves the Marcus screen. Chutes *M*, *N* and *O* are provided with perforated bottom plates, and any fine coal made after leaving the screen is removed and carried to the rescreening screw conveyor. This carries it back and unites it with the ½-in. dust at chute *K*, which delivers to a cross screw conveyor, which deposits all fine coal in a small bin at the side of the tipple. This dust is either used under the boilers or carried to a waste pile, depending on its condition. If it is desired, the fine coal from the chutes *M*, *N* and *O* can be dropped into the railroad cars from the screw conveyor through the slide gate *P*.

An additional gate *F* has been placed in the bottom deck of the screen so that in the future 3-in. nut coal can be taken on a conveyor up the track and delivered to a bin over track No. 2 and thence to another box-car loader installed for putting this 3-in. coal into box cars on track No. 1.

By the installation of this equipment it will be apparent that the Moffat Coal Co. has not only been able to materially increase its output, but at the same time to materially improve the quality of each and every grade of coal marketed, except of course the 6-in. railroad fuel, which is loaded without further preparation.

It should also be noticed that this new equipment was installed in an old tipple without changing any of the apparatus above the weigh hopper. This hopper, together with the tipple scales, cross-over dump, etc., was not disturbed in any way, while only slight changes were made in the tipple structure. The great improvement therefore made in this plant, at relatively small expenditure, illustrates the adaptability of the Marcus horizontal screen and picking table in meeting the varying conditions in different tipple structures as well as the requirements of the markets in different coal fields.

This equipment was designed and installed by the Roberts & Schaefer Co., of Chicago, which owns the exclusive patents in the United States for the Marcus screen.

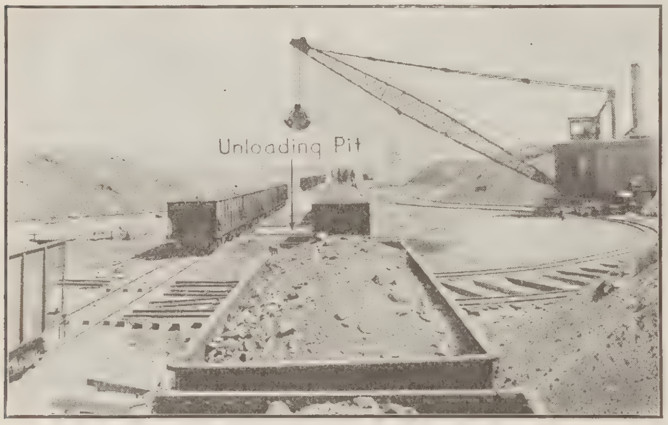
Storing Bituminous Coal at the Mine

By Julius S. Holl*

SYNOPSIS—Storage of coal at the mine does not involve large expense for machinery. With a small expenditure for equipment, coal can be stored and reloaded at a cost of 4c. per ton.

The methods used by coal operators for selling their product are still somewhat antiquated and need remodeling by engineers if larger returns are to be expected in the way of dividends.

If, for example, an order for 30 or 300 cars of Pocahontas is received at the mine, shipment is made only as fast as the coal is mined. If strikes, weather conditions or other delays occur, the buyer must wait, and wait he does, believing the delay inevitable and one which could not be foreseen or prevented. He has been used to waiting, or trying to anticipate his needs far in advance, and he takes it for granted that delays are necessary.



A Central Pit, Two Concentric Tracks and a Crane Form a Simple Means of Storing Coal

This condition of affairs is very much as it was generations ago when a man wished an all-wool garment for protection during the severe winter. First he had to get and shear his sheep, then take the wool to his home to be spun into cloth, from which finally the family made him as good a suit as their ability in this work permitted. Naturally the time between the shearing of the wool and the wearing of the clothes seemed long. It was long, compared with our present-day methods, for a man can go into almost any clothing shop and inside of half an hour purchase a better suit than our friend of long ago, and make his selection from a large variety of *stocks*. On the other hand, we can well imagine winter pretty far advanced before the suit of our forefathers was ready for the good use expected of it.

Need for Coal Stocks

Primitive methods involving delay and uncertainty have had to pass away in the evolution of the clothing business. Success and profits were not to be attained by those who neglected the manifest needs of their clients. It is also true that coal miners and shippers would increase their profits, and incidentally their usefulness to the community, by carrying coal in storage for immediate shipment. They will be more successful in the conduct of their business than those who ship out their orders only as the coal is mined.

The storage of bituminous coal in large quantities at tidewater, or, if for inland consumption, at other points, would also mean uniform operation and production at the mines all the year round, which tends largely to solve the labor problem. This in itself should appeal to the operator as well as the miner. To the operator steady work means protection and increased profits; to the miner, steady work and contentment. Continuous daily operation and output mean efficiency and economy at the mine, just as in the manufacture of automobiles or any other commodity.

The Gulf Smokeless Coal Co., of Norfolk, Va., was one of the first companies to appreciate the advantages of reserve coal storage. It was keenly interested in all devices and types of machines employed for such work, and after an exhaustive study of methods it decided upon the circular storage locomotive crane. This machine has successfully solved the problem. Not only the investment cost is low, but the cost of handling also. It has been conclusively proved a cheap and dependable storage system for large bodies of bituminous coal.

Little Beside a Locomotive Crane Needed

The circular storage system is suitable for capacities of from 6000 to 100,000 tons and upward. It consists of a steam or electrically operated long-radius locomotive crane, equipped with self-filling grab bucket, running on a circular track around a central track hopper, into which coal is dumped from railroad cars. The idea is shown clearly by the illustration of the Michigan Alkali Co.'s coal crane on the front cover and by the illustration of the Gulf Smokeless Coal Co.'s arrangement at Sewall Point, Va. Coal is taken from a central pit by the bucket and delivered to the storage pile, which, when full, assumes a circular outline. By continuing the track system and building more pits, a succession of storage piles can be formed with a single crane. As much as 100,000 tons of coal are stored in each circular pile.

When reloading, the coal is taken from the pile by the bucket and delivered into railroad cars or carts. The crane has a capacity of from 40 to 200 tons per hour, according to the size of the bucket and crane employed. The length of the boom depends to a great extent upon the storage capacity required.

The idea of carrying coal in storage is not new. The anthracite coal miners have stored all sizes for years, and today plant capacity for over 5,000,000 tons is actually in existence, and the labor-handling cost in and out of storage of these millions of tons by highly perfected machinery is less than 5c. per ton. The bituminous-coal operator is now confronting the same needs as were so successfully met by the anthracite coal miners some 20 years ago, but he has an advantage over the hard-coal operators because simple standard machinery can be used for storing bituminous coal, whereas on account of the necessity for keeping hard coal graded in sizes special equipment had to be invented and built for the storage of anthracite and this involved both capital and time.

---

*Chicago, Ill.

The crane used by the Gulf Smokeless Coal Co. was designed primarily for storing coal, but it is a more or less standard machine made by the Link-Belt Co., of Chicago and Philadelphia, and used successfully for handling stone, gravel and limestone as well as coal. The labor cost of putting coal into and taking it out of storage varies somewhat with the local conditions. A fair average, however, would be approximately 4c. per ton for the entire handling.

The New York Edison Co. operates two of these cranes at Shadyside, N. J., for storing coal. The capacity of the plant shown on the front cover is 200,000 tons. The cranes are of the same type as used by the Gulf Smokeless Coal Co., running on 20-ft. gage tracks and each operating a 3½-ton grab bucket.

The circular storage system itself is patented and the rights are held by the Link-Belt Co. By using a small crane, the system is as well-suited to storage of modest size as it is to the large installations illustrated.

⁂

Extracts from a Superintendent's Diary

My predecessor spent several hours in camp today renewing old friendships. During the past few years he has been operating a coal mine on some land which he blocked up while he was with our company, but last week his creditors threw his concern into bankruptcy, and he is wandering around now trying to get his bearings. He was in my office about an hour and during that time gave me a rather complete account of the ups and downs of his career since he launched forth as an independent operator.

Everyone in camp remembers him as a successful superintendent, so when the news reached here that the sheriff had taken charge of his affairs, no one knew just what to think about it. It now transpires that his enterprise was destined to failure from the first because of unfavorable conditions which one of his experience might have been expected to foresee. He is broad enough to admit as much; moreover, he is perfectly willing to let others profit by his experience.

It is pretty difficult to profit by the experiences of others, but I feel that in listening to his comments to-day I obtained a glimpse of the coal-mining game from a new angle and the impression burned deep. I learned that a man may hold a responsible position in the operating end of a large coal-mining corporation for years and never realize one-half of the problems that some one has had to work out. For example, how many superintendents known of the tabulations that are required in advance to determine whether a certain tract of coal land has any chance of success, if it must be opened on a particular railroad?

Mr. May's coal seam was of average thickness and the quality would have been considered satisfactory in certain markets; it was of similar quality to the coal he had previously mined, but unfortunately the customers reached by the railroad which served his mine preferred a different class of coal and accepted his fuel only at low prices. As the railroad would not allow its cars to be billed to points beyond its own lines he could not even reach out for markets that were favorable.

Another trouble with the railroad was that it was short of coal cars, and in winter, when the demand for coal became acute, it could not furnish sufficient cars to insure continuous operation of all of the mines on the line. In summer, when the demand for coal was slack, there were plenty of cars to go round, but then there was absolutely no chance to make a profit.

Our company sells a certain percentage of its coal during the summer months to the railroad that serves our mine and receives a fair price for it. The railroad that connected to Mr. May's mine believed in squeezing its fuel contractors whenever squeezing was possible, so Mr. May had no chance there. On top of this, the railroad officials were very arbitrary about assessing demurrage charges for cars ordered in and not promptly loaded out, and in consequence there was little love lost between the local railroad officials and his own clerical force.

Still, he might have pulled through in spite of all these obstacles had he been familiar enough with the sales end of the business to know that all coal contracts are not as binding as, say, indorsements of rich men on notes made by poor men. In the dullest part of the season his largest customer canceled his contract because he got a better price, and that was the last straw that broke the camel's back.

⁂

Ballads of a Coal Miner—I

By Berton Braley

I struck the pitboss for a job today,
  And you'd 'a' thought, the way he growled at me,
That I was some panhandler in the way,
  Whinin' an' askin' him for charity.
I ain't no bum, no beggar an' no shirk
  An' I ain't wantin' nuthin' I don't earn,
An' when I comes around to look for work
  I likes a decent answer in return.

I wonder why it is that when some guys
  Gets just a little power in their grip
They sort o' swells to twice their normal size
  An' thinks they got the whole world on the hip.
The real big men ain't never built like that,
  They don't think that they gotta be so gruff,
But when a feller ain't sure where he's at
  Why then of course he has to throw a bluff.

That was the way that grumpy pitboss done—
  He growled an' swore an' grumbled when I came,
An' when he'd let his temper have its run
  He grunted that he'd hire me, just the same.

⁂

Financial Condition of the Pittsburgh Coal Co.—Back dividends of about 42 per cent. have accrued on Pittsburgh Coal preferred. That company recently disposed of a large portion of its coal lands, receiving upwards of $9,000,000 therefor, and it is felt that when the coal business improves the proceeds of this sale will be used in some method to redeem the accumulated dividends. Various schemes of effecting this have been advanced, but none has apparently received deliberate consideration. Pittsburgh Coal in its best year (1913) earned about $2,700,000 for dividends, or only about 10% on the outstanding preferred. Assuming that back dividends were paid in stock on that basis of earnings, the full 7% on all stock issued could barely be shown. At present 5% is being paid.—"Boston News Bureau."

Analysis of Illinois Freight Rates

By E. J. Knickerbocker*

The accompanying map shows the larger railroad coal properties in Illinois and Indiana. The railroads secured these coal lands for the purpose of protecting their fuel supply. Some of the properties have been developed, the roads mining their own coal supply, while others are held for future use.

The freight rate zones are shown in dotted lines, and the minimum and maximum distances to Chicago, using the short and direct lines of railroad, are as follows:

From northern Illinois or 57c. rate group—Coal City, Ill., minimum, 59 mi. via C. & A. R.R. Aledo, Ill., maximum 176 mi. via C. B. & Q. R.R. Co.

From Springfield, Ill., or 82c. rate group—Mt. Pulaski, Ill., minimum 168 mi. via I. C. R.R. Glen Carbon, Ill., maximum 277 mi. via I. C. R.R.

From southern Illinois, or $1.05 rate group—Mt. Vernon, Ill., minimum 276 mi. via C. & E. I. R.R. Carrier Mills, Ill., maximum 326 mi. via C., C., C. & St. L. Ry.

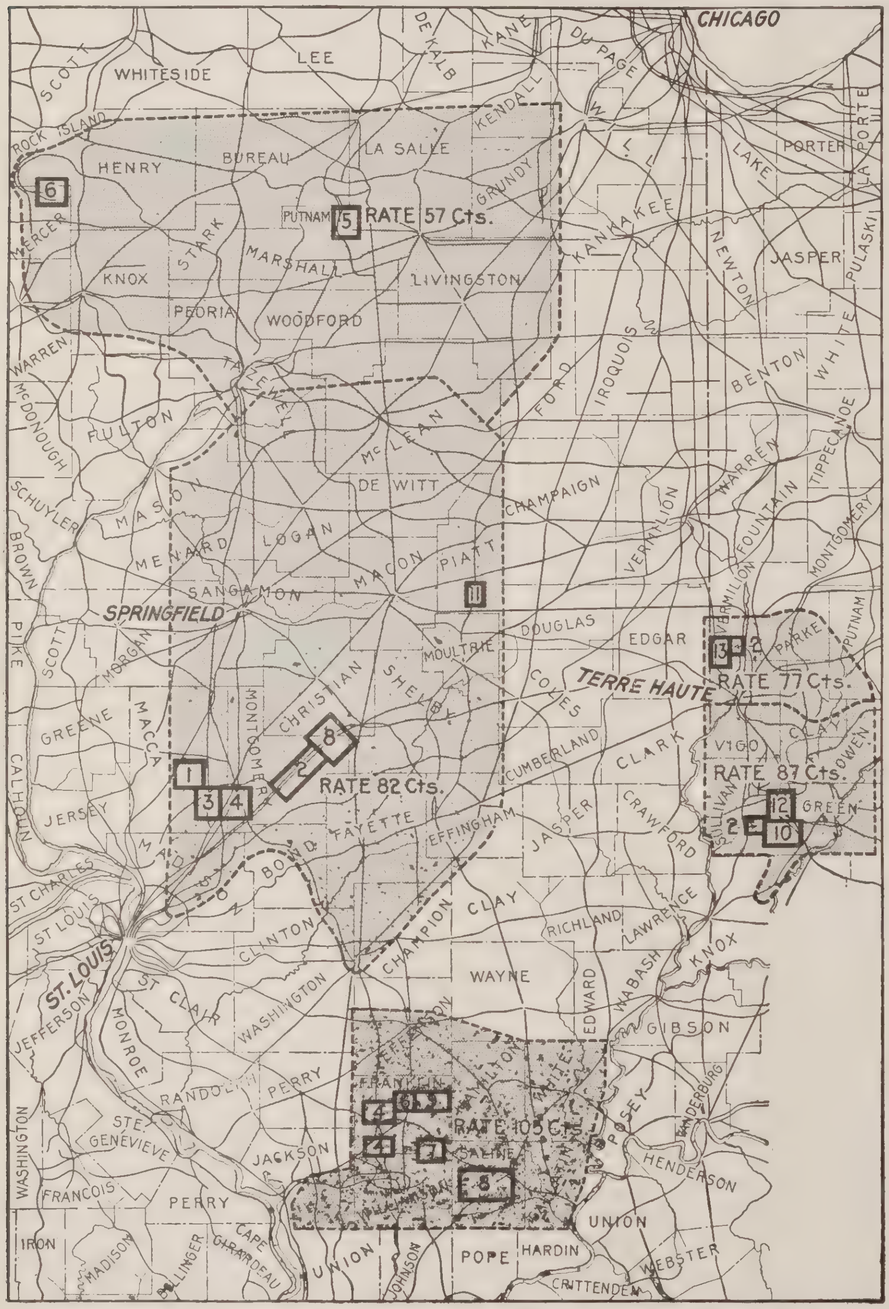
From Brazil-Clinton, Ind., or 77c. rate group—Clinton, Ind., minimum 163 mi. via C. & E. I. R.R. Carbon, Ind., maximum 206 mi. via. N. Y. C.

From Sullivan-Linton, Ind., or 87c. rate group—Siefert, Ind., minimum 192 mi. via C. & E. I. R.R. Paxton, Ind., maximum 210 mi. via C. & E. I. R.R.

Previous to 1906 there was no well-defined basis of rates to Chicago or other markets, and the rates published up to that time did not reflect the actual rate adjustment. As a rule if any one railroad felt that it was discriminated against, it overcame this by making a rate that would put its operators on a competitive basis, and this often resulted in the coal being carried at very low and ruinous figures.

It does not necessarily follow that rates published in 1906 are just or equitable today, as a rate that may have been thought fair nine years ago, or even two years ago, may by reason of changed conditions be an unfair rate today. As an example we may take the rate of 77c. from the Clinton-Brazil district as against rate from the Sullivan-Linton district of 87c. When the differential of 10c. was established between these two districts, the average grade of coal produced in the Sullivan-Linton field was better than that from the Brazil-Clinton district. This is owing to the fact that prior to 1907 there was very little of the No. 4 seam coal mined in the Brazil-Clinton district, while this seam was the principal producer in the Sullivan-Linton district. Today the conditions are reversed.

This map also shows quite clearly that while distance is a factor in establishing rates on coal there are other equally important considerations. The value of the fuel, f.o.b. point of consumption, is what really fixes its railroad rate. Cost of production and the ability of the railroad to transport the coal at a living rate determine the available market and the price of the coal in the market.



Explanation of numbers and markings on the illustration: Coal-land holdings: 1. Chicago & Alton R.R. (U. P. R.R.). 2. Chicago & Eastern Illinois R.R. Co. 3. Chicago & Northwestern Ry. Co. 4. Chicago, Burlington & Quincy R.R. 5. Chicago, Milwaukee & St. Paul Ry. 6. Chicago, Rock Island & Pacific Ry. 7. Illinois Central R.R. Co. 8. New York Central Lines. 9. United States Steel Corporation. 10. Vandalia R.R. 11. Wabash R.R. Operations: 12. Monon Coal Co. mines and holdings. 13. Mines located on Chicago, Terre Haute & Southeastern R.R. Dotted lines: Freight rategroups with local rate to Chicago.

Railroad Coal Properties and Rate Zones in Illinois and Indiana

*Assistant to vice-president, Central Coal & Coke Co., Kansas City, Mo.

Evolution of Retail Coal Trade in New York City

SYNOPSIS—A brief sketch of the methods prevailing in the retail coal trade of New York City. Modern appliances and large investments have become essential, owing to the close competition for business.

Not only the machinery but the geography and number of retail coal yards in New York City have made great changes in the last 30 years. Three decades ago there were about 300 retail coal dealers in New York, and but few of them had yards on the water front. Today there are about 60, and the inland yard is now practically a thing of the past. The change in geography is owing to the prohibitive cost of hoisting the present great consumption of coal from the boat, hauling it to an inland yard, and then reloading it to deliver to the consumer. The decrease in the number of coal dealers is due to the expensive equipment now necessary to make the enterprise profitable and to the fact that it is next to impossible to lease or buy water-front property, it being mostly owned by the city.

Years ago a customer ordering seven tons of coal would receive seven different deliveries in a one-horse one-ton truck. To day the three-horse truck with five- or six-ton load and the seven-ton auto truck have come to stay. All these horse trucks and the majority of the auto trucks are now elevated by hand with a crank so as to chute the coal into the bins. The motor hoist is in use on some of the latest types of auto trucks. Greater distances to cover and rapidity of delivery are two other necessities which have made the investment in all this expensive equipment unavoidable. A motor truck does not tire, and the last load at night is delivered as quickly as the first load in the morning.

Large Tonnages Handled

The consumption of coal has kept pace with the increase in population, and now some of the great New York office buildings use 20, 30, 50 and even 100 tons a day. With the old-time methods of delivery these could not have been supplied. An auto truck can deliver as much as 125 tons in a day, depending upon the length of the haul. It hauls as much as the old-time railroad car.

At the old-fashioned yards coal was hoisted from the boat by horse power with the ordinary block-and-fall bucket system, and it was considered quite an exploit to handle 100 tons a day. Now many of the yards handle 1500 tons a day in the ordinary course of business, and a clamshell digger which will hold from 1000 to 4000 lb. is the means by which coal is hoisted from the boat. Formerly the coal was stored on the ground and shoveled up into a truck. Nowadays great coal pockets of wood, steel or concrete are maintained by the retailers, and their trucks are filled rapidly by the release of a lever.

The telephone has proved an added facility for the consumer, but an added expense for the retailer. Every modern retail coalyard must have at least one trunk line, and some have as many as a dozen. Deliveries are now made within an hour, and short-weight deliveries are a thing of the past. The Retail Coal Protective Association was inaugurated and laws passed covering the system of making out delivery tickets. At present there are 32 inspectors and one coal trade inspector empowered by the Mayor to take any coal truck to the nearest official public scale and reweigh the load. The penalty for short weight is from $50 to $100.

Coal Pirates of New York Harbor

Another evil that has been eliminated is the petty thieving in transit and especially piracy on the Kill von Kull. Formerly the coal barges were held up and robbed on this stream by petty pirates in oyster boats. At the instance of the New York Coal Merchants Association police launches conducted naval operations against these pirates, and today many of them are serving terms in Sing Sing. This association has coöperated with the authorities and also worked independently for the elimination of all abuses in the trade.

The cost of labor has increased. Drivers of the old-fashioned carts were paid $1 a day. This was advanced to $1.25 and $1.50 and today a two-horse driver receives $2.67 a day, a three-horse driver $3 and a chauffeur on an auto truck $3.66. The price of horses has trebled, the hours of labor have decreased, and insurance on the present big plants is an expensive item. The original investment now necessary to maintain a successful retail coal plant in any city has largely increased on account of the additional storage facilities it is necessary to maintain and the more elaborate equipment. Years ago the retailers owned no barges, and the largest carried about 150 tons. Today many retailers maintain heavy ice-breaking barges which carry from 300 to 1800 tons.

A Siberian Coal Property

War does not close down business in the belligerent countries, and in some of them activity directly results from the state of war and the resulting developments will continue long after its close. Despite the demands of the treasuries of Europe the Irtysh Corporation is floating stock in London, England, for a $10,000,000 operation to mine a sulphide ore near Ust Kamenogorsk containing gold, silver, copper, lead and zinc and to operate a deposit of coal at Ekibastus not far from the Irtysh River in Siberia.

The Irtysh is a navigable tributary of the Ob, or Obi. It lies not far distant from the line dividing Russia from Siberia. The Ekibastus coal deposit lies in the province known as Semipalatinsk. The ore and the coal are nearly 100 miles apart, and a narrow-gage railway will have to be built following the Irtysh River from Ust Kamenogorsk to Yermak.

A Steam-Shovel Should Give the Best Results

The coal measures belong to the Carboniferous system, and the basin appears to lie in the form of an elongated canoe about 8 mi. long and averages about 2½ to 3 mi. wide, narrowing toward each end. The coal deposit will be hard to work as it is 230 ft. thick and is intermixed with shales. The coal comprises about 75 per cent. of the whole bed. Apparently the corporation expects to mine the property by drifting, but there seems no reason why it could not be worked more profitably at first by steam-shovel open-cut methods.

The dip is considerable—25 deg., or almost 47 per cent. However, as the ground is level there must be a band around the basin about 1037 ft. wide, with a cover not exceeding 230 ft. at any place. Twenty miles of such a ribbon of coal would contain, if 230 ft. thick, no less than 761,622,400 tons.

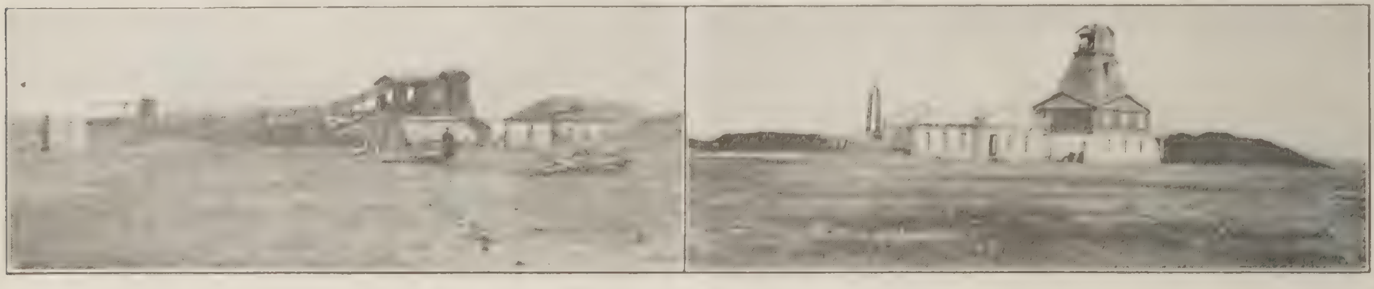
Some of this coal would be worthless because too near the outcrop, and some of the bed is not coal, but slate. It has been figured here as if of only equal weight with coal. Hence if 50 per cent. of the whole volume of the bed stripped is rejected there are 380 million tons of available coal, and the rest of the bed can be mined by the less desirable drifting methods. It is believed there are other beds below that mentioned, but this has not been proved.

NONE OF THE COAL IS OF HIGH GRADE

The value of the steam shovel in heavily dipping beds in a level country has not been as generally recognized as it should have been. It would appear regrettable that the company is thinking of taking out three beds measuring 4 ft. 6 in., 4 ft. 3 in. and 5 ft. 1 in., thus spoiling the rest. The analyses are as follows:

	No. 1 Bed	No. 2 Bed	No. 3 Bed
Fixed carbon	56.76	55.49	52.97
Volatile matter	30.66	20.70	22.78
Ash	10.58	19.00	20.54
Moisture	2.00	4.81	3.71
	100.00	100.00	100.00
Sulphur	1.95	0.38	0.96
Fuel ratio	1.85	2.68	2.32

Geologists will be interested in the remarkable thickness of the deposit and in the wide variation in the fuel ratio of beds so closely associated. These variations in the coals, if correctly reported, suggest geologic trouble and seem further reasons for using a steam shovel. The devolatilization of No. 2 bed hints in our belief at the presence of underlying sills of volcanic rock or else of bodies of such rock which have been thrust between the coal beds. The information at hand does not state whether the beds are numbered upward or downward or indeed in their correct sequence. The first bed makes a coke suited for use in copper or lead furnaces.



THE EKIBASTUS COLLIERY, SEMIPALATINSK, SIBERIA

The view at the left shows the main incline; that at the right the old vertical shaft and buildings now converted into a machine shop, with coal heaps in the background. Note that the ground is absolutely level and that the gradient of the coal bed is roughly 50 per cent., assuring a large area with light cover

Forster, Brown & Rees, of Guildhall Chambers, Cardiff, are the engineers for the coal operations, and the Russo-Asiatic Corporation, of 7 Gracechurch St., London, E. C., are floating the stock.

⁂

The Southern Appalachian Coal Operators' Association will hold its semiannual meeting July 23, 1915, at Knoxville, Tenn. J. E. McCoy, Knoxville, Tenn., is secretary.

⁂

The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Secretary, Lewis Richards, 212 East Green St., Nanticoke, Penn.

The Labor Situation

In Ohio the executive and legislative committees of the miners' organization met at Columbus recently to take action on the question of circulating petitions to bring the Gallagher amendment of the Green antitrust law to a referendum vote. There was much difference of opinion, but it was finally decided to circulate the petitions. The announcement was made that the Ohio Federation of Labor would aid in the canvas. If the petitions are to be valid they must be filed in 80 days. The campaign will include a publicity bureau and stump speaking, but the miners will not coöperate with the state Democratic headquarters as it is the intention to make the fight nonpartisan

The Youghiogheny-Pittsburgh Coal Co. on June 7 filed an injunction suit against the United Mine Workers of America, District No. 5 of the United Mine Workers of America, Van Bittner president, Robert Wood secretary, and also against the individual defendants, Van Bittner, Robert Wood, Philip Murray, William Hargest, James Reed, John Kafula and James Crawford Hearing was set for June 14

The plaintiff seeks to enjoin the defendants and others who may be associated with them from withdrawing the workmen and employees from its employ and from issuing orders to the workmen of the plaintiff company to cease work in the mine under the "thick vein" scale of mining.

The court is asked to ascertain and fix the right of the plaintiff company to have its coal mined as the "thick vein" coal, and after a hearing, if the court determines that the coal of the plaintiff is of the thickness being mined in other places as "thick vein" coal, then to enter a decree of injunction restraining the defendants from thereafter interfering with the operation of the plaintiff's mine as a "thick vein" mine.

Does the Location or the Character of Coal Determine Its Classification?

It is understood that the action is of an amicable character, to get the court to determine whether the coal is rightly termed "thick vein" coal. The mine at which the question was raised is a new operation in Fallowfield township, on the Pigeon Creek branch of the Pennsylvania R.R. The company has at that point about 900 acres of coal of the Pittsburgh bed. Mining operations were begun about Apr. 15, 1915, and were continued up to the beginning of the present month, when the dispute as to the classification of the coal arose.

It is maintained that a short distance back from the Monongahela River the coal is of the quality and thickness known as the "thick vein" coal and is so recognized by the defendants. There is a scale of wages adopted for this coal. The contention of the coal company is that at this mine, just opened by it, the coal is of such a thickness as to permit it to come under the "thick vein" coal scale. This scale was accepted from the time the mine was opened in April and until the opening of the present month, when it was classed as "thin vein" mining. The miners were notified that unless the company agreed to pay "thin vein" mining prices they would have to quit work.

The plaintiff company says in its petition: "A large part of the coal owned by your orator was purchased from the Ellsworth Collieries Co. and was a part of a larger body of contiguous coal owned by said Ellsworth Collieries Co., which coal at and prior to the time of purchase by your orator was being operated and mined by the said Ellsworth Collieries Co. on the thick-vein scale of wages. The cost of producing coal under the thick-vein scale is approximately 5c. per ton less than under the scale for the thin coal."

Mine Inspectors' Institute, U. S. A.

By J. T. Beard

SYNOPSIS—Brief outline of the aim and objects sought to be accomplished by the organization. Summary of the proceedings of the eighth annual meeting held at St. Louis, Mo., June 8-11, 1915.

The eighth annual meeting of the Mine Inspectors' Institute of the United States of America was held at St. Louis, Mo., June 8-11, 1915.

The institute is composed of the mine inspectors of the several coal- and metal-mining states and of the provinces of Canada, besides persons commissioned by the Federal Government to act as director of the Bureau of Mines and chiefs of divisions or sections of said bureau. The membership includes both coal- and metal-mine inspectors. The object of the organization, briefly stated, is to secure greater uniformity in the laws regulating mining operations; a wider dissemination of practical and technical mining knowledge, to increase the efficiency of mine-inspection work and insure the better protection of the lives and health of mine workers and the security of mining properties and conservation of mineral resources; to establish a closer relationship between mining bureaus and inspectors in all states and provinces, and to strive for the betterment of mining conditions.

The first session of the institute, Tuesday morning, June 8, was devoted to addresses of welcome to the city and the usual address by the president of the institute, John Dunlop, of Peoria, Ill., which was followed by the appointment of the committees on membership and resolutions. The session was immediately followed by a meeting of the Executive Board to arrange the details of the program prepared by the entertainment committee.

The afternoon session of the same day was opened by the report of the committee on resolutions, which presented numerous applications for membership from many new and old inspectors. The applications were acted upon promptly by the members present to enable the new members to enjoy the full benefit and privileges of the institute at its present session.

The remainder of the afternoon session was devoted to a very interesting and profitable discussion of the need of greater uniformity in mining legislation and the hindrances in the different states in securing such uniformity. Emphasis was laid on the fact that the conditions of mining were so different in different districts and localities that it was a practical impossibility to secure absolute uniformity in the details of mining operations; but it was explained that there were certain general requirements in respect to the safety and health of mine workers that were essential and that these general requirements were the same in all mining states, provinces and districts.

The evening of the same day was devoted to a visit to Forest Hill Park, which was greatly enjoyed by those who accepted the invitation of the entertainment committee.

At the morning session, Wednesday, June 9, the discussion in regard to unformity of mining legislation was resumed. The discussion at this time was confined to whether the mine foreman, assistant mine foreman and fireboss should be required to qualify for such position before a duly authorized examining board. Following the discussion, a resolution was unanimously adopted indorsing the need of suitable qualifications on the part of all candidates for positions involving the direct charge and direction of underground operations.

The remainder of the morning session was devoted to an animated discussion relating to the use of gasoline motors in mines. In the absence of W. L. Morgan, who was to have led this discussion by a specially prepared paper, the members joined in the impromptu expression of their opinion in regard to the utility and safety of employing such motors underground.

While the majority of those who discussed this question were opposed to the use of gasoline motors in mines, no final action was taken by the institute on the question.

The afternoon session was devoted to a very enjoyable automobile trip extending throughout the various sections and suburbs of the city. This was also provided by the entertainment committee.

At the smoker and banquet the same evening, addresses were made by the following: A. J. Moorshead, president and general manager of the Madison Coal Corporation, St. Louis, Mo.; John Dunlop, Peoria, Ill., president of the institute; H. M. Wilson, chief engineer of the Federal Bureau of Mines, Washington, D. C.; J. J. Rutledge, mining engineer, Bureau of Mines, McAlester, Okla.; Thomas Jeremiah, chairman of the committee on coal mining investigations, Willisville, Ill.; R. Y. Williams, director Miners' and Mechanics' Institute, Urbana, Ill.; John P. Reese, president Illinois Mining Institute, Gillespie, Ill.; Edward Flynn, safety inspector, T. C. I. & R.R. Co., Pratt City, Ala.; E. A. Collins, inspector of mines, Ontario Bureau of Mines, Cobalt, Canada; J. W. Paul, mining engineer, Federal Bureau of Mines, Pittsburgh, Penn.; J. T. Beard, associate editor, COAL AGE, New York City.

The session Thursday morning, June 10, was devoted to an address by H. M. Wilson, on various elements and features relating to the securing of uniformity in mining reports. This was followed by a brief discussion of the inconvenience caused by the difference between the fiscal and calendar years in different states, in summarizing the reports of the state mining departments. This was followed by an excellent paper prepared by Dr. J. J. Rutledge, in charge of mine inspection and investigation, in the Indian lands of Oklahoma. Dr. Rutledge's paper was a careful review of the dangers arising from the use of explosives in coal mines.

The afternoon of the same day was given up to a visit to the Anheuser-Busch brewery, where the members who availed themselves of the invitation of this company to visit the plant were most courteously entertained. A visit was also made to the St. Louis Botanical Gardens, which was much enjoyed by all present.

The banquet given to the institute by the mine inspectors of Missouri, the same evening, was largely attended. The morning session, Friday, June 11, was devoted to the report of the committee on resolutions, the election of officers for the ensuing year and the selection of the place for the next meeting, which by unanimous vote it was decided to hold at Joplin, Mo. The result of the election of officers will be announced later.

Editorials

Standing Armies

Those who read the *Appeal to Reason* and the *United Mine Workers' Journal* will know that the miners' unions are firmly of the opinion that standing armies are the great incentive to war. Do away with them, they teach, and war will be at an end.

Those who not only read these interesting papers but also think for themselves will realize that if there were no standing army like the United Mine Workers of America there would be no incentive to industrial war. Do away with the union, and the turmoil will be at an end.

But standing armies are sometimes necessary, and sometimes the union prevents cases of petty tyranny. We are not calling for the suppression of either, but for the considerate use of both. In fact if justice can be secured without army or union, we should be glad to see both abolished.

Unfortunately the people who maintain standing armies like to use them whether those people be banded into democracies or autocracies and do tend to use them, not only to correct abuses and to resent aggression, but to impose hardships and to overthrow a proper self-defense.

And the standing army of the union is no exception. Every two or four years as soon as the treaties expire—and sometimes, even frequently, betimes—the whole strength of the union or of the local is used to secure some concession from the operators, regardless of justification. We shall never abolish standing armies entirely though we may forbid them to individual nations, and we shall never suppress the union though we may make it amenable to arbitration.

In time perhaps we shall manage to induce the miners to be more conscionable in their use of their weapon. Some men carry a revolver for a lifetime and never use it. Some people pay premiums on an insurance policy till they die, and never regret that they have to die to win. But unfortunately the miners do not so regard their standing army.

It costs money; it must biennially, annually, even daily produce results. It must always be active, marching, countermarching, intimidating, always on the firing line. Whoever doubts for what that martial body is used let him read the "Army and Navy Journal" of the United Mine Workers, which is not concerned with the efficiency of the union at all, but with the one question—where its services can be best used.

Such an accursed militarism can have but one result—the perpetual turmoil which surprises William Le Baron and makes the mining industry a matter for general reprobation. In view of this fact, is not the call for character the great demand of the mining industry—character for the operator that he may be fair to his men, character for the miner that he may not abuse his strength to the disadvantage of himself and others?

The miner in the union has a weapon in his possession. It is to be hoped that he will use it rightly or keep it in the hip pocket of his jeans and not brandish it so unthinkingly or menacingly on every available occasion.

The miner does not believe one half that he asserts about the operator. Many of his diatribes resemble the facts as closely as the symbols of things in a Chinese play. Those who go into an Oriental theater and see a bamboo pole miss the point because they do not know it represents a tree. Those who hear the operator denounced as an ogre are frequently oblivious to the fact that the man thus thrashing himself into fury really knows that his employer is a man of most excellent qualities. In fact the language of diatribe is a tongue as well developed as that of baseball or thievery. It no longer tries to be exact. It is intended only to stir the passions and provoke revolt. That it is successful, the frequent labor wars in the coal regions fully attest.

⁂

The Northwestern Market

The producing coal companies of the Pittsburgh and West Virginia regions are naming in the Northwestern markets lower prices than at any time for several seasons past. This is notably evident in Minneapolis and St. Paul. These reductions in price include three-quarter Youghiogheny for lake loading and West Virginia splint.

The Pittsburgh and West Virginia shippers are evidently exerting great pressure on dock companies to induce them to absorb a heavier tonnage than ever before at low prices. Consequently, some of the Indiana and Illinois operators have had to cut prices on contract business in the Northwest.

⁂

The Situation in Indiana

An interesting side-light on the present condition of the coal trade in the State of Indiana is thrown by the recently issued annual report of the Vandalia Ry. The coal traffic of this road shows a reduction of 651,839 tons from that of the preceding year. The major portion of the coal tonnage of the Vandalia Ry. originates at Indiana and Illinois mines, and these figures of one leading coal carrier are a fair index of the declining state of the industry during the past season.

It is estimated that 70 per cent. of the 22,000 miners in Indiana are obtaining only enough work to meet the cost of living, and about 6000 men are entirely idle. Fortunately the miners of Indiana after July 1 will be relieved of the 50c. per month special assessment made by their national organization. The Clinton miners have petitioned the Governor to call a special session of the Legislature to deal with their lack of employment.

If all the stories of miners returning to Europe are to be credited there will soon be no difficulty in providing steady work for those now working irregularly. The prospect of a general strike next year will also serve to speed general business, which has moreover already taken a turn for the better.

The Trend on New Contracts

In the coastwise trade, the most significant contract placed the last few weeks was the 400,000 tons awarded the Crozer-Pocahontas Co. by the Navy Department (No. 664, Class 8, Vol. 7, pp. 836, 953, 954, 955, 1006) at $2.60 f.o.b. Hampton Roads. It was something of a surprise that this contract was taken at 10c. less than the Panama R.R. contracts early in the season, and the fact that the same price was named for Pocahontas that last year was the successful bid on a Cambria County coal at Philadelphia seems to reflect a determination on the part of West Virginia operators to remain close competitors for Government business. It further shows that they are not so sanguine of a broad export market as buyers have been led to believe.

The 47,000 tons for the 15 institutions under the Massachusetts State Board of Insanity (No. 486, Vol. 7, pp. 665, 915, 1005) was awarded at prices 5 to 10c. less than last year, both all-rail and at tide. The bids disclosed a lively competition for the tonnage and confirmed the general impression that the shippers in Pennsylvania as well as in West Virginia, are very keen for new business. The successful bidder on 6500 tons that could be delivered by team in Boston submitted a Cambria County coal, a fact of interest to the Boston dealers. That the trade is still eager for new business also appeared in the prices submitted for the City of Boston Harbor Institutions (No. 461, Vol. 7, pp. 627, 748, 794, 836, 956) amounting to 42,000 tons. This contract was advertised no less than three separate times, the second and third times in the effort to get lower prices, but as it turned out the last tenders were a few cents higher than the second. Prices on the whole averaged this year only a trifle lower than in 1914.

At Philadelphia the anticipated surprises happened in the award of the contract for supplying the Board of Public Education with 52,000 tons of anthracite (No. 508, Vol. 7, pp. 665, 955 and this issue). The largest number of bidders on record presented tenders—23 in all. Considering the price at which pea coal was awarded, $3.54, it is interesting to speculate as to what company or companies will supply the successful bidder. Subtracting the freight, $1.40, from the price this leaves the dealer $2.14 for his coal and expenses.

At a price like this, profit of course is not a consideration, and the opinion seems general that the coal will be furnished at a figure not higher than $1.75 at the mines, and possibly as low as $1.60. It is altogether likely the successful bidders took the coal at this low figure simply in an effort to maintain their delivery organization during the summer season.

In the Kentucky market, the tendency toward a lower price-level was clearly exemplified in the award of the State Prison contract No. 531 (pp. 357, 478, 1050) involving 19,000 tons. The principal unit of this contract covering about 12,000 tons was let at $1.98 per ton, or only 2c. under the old figure, but the balance of the contract, about 7000 tons, was closed at 12c. per ton under the old figure. Had it not been for the fact that the West Virginia operators were unable to bid on this contract because of the uncertainty regarding the decision of the Interstate Commerce Commission on freight rates, it is highly probable this business might have been concluded at even lower figures.

Screened Coal in Middle West

Prices are strongly maintained by the smokeless coal operators in the Middle West, and they are now receiving unusually high prices for screened sizes. Genuine Third-Vein Pocahontas screened sizes are strong, and $1.90 is the best price at which they were offered in the Chicago market recently.

On the other hand, Pocahontas mine run is being sold as low as $1 per ton at the mines, and it is quite apparent that more mine run is being produced than the present market will absorb, although it is confidently expected that toward the end of the month the mine-run demand will quicken into activity at a minimum figure of $1.25. Few contracts are being closed, and retailers are buying more lump and egg than shippers are sending to this market, which adds strength to the sizes.

Splint shippers have passed through a most discouraging period, but it is apparent that the displacement of the large tonnage of smokeless products by the heavy demand abroad and in South America has caused a widening in the demand for splint coals by those who can substitute them for smokeless. In consequence those who have splint coal to sell have had less difficulty in finding buyers, and the supply and demand have been more nearly equalized. The new Splint Dealers Organization in West Virginia seems to be able to curtail production more nearly to the actual demands of the market. The condition, however, is still far from satisfactory.

Prospects of Foreign Trade

The export demand promises to be an important feature of the coal market for the next few months. Among the new inquiries is one of 200,000 tons from France, another of 4000 tons from the same country, and two of 18,000 tons each and another of 150,000 tons from Italy. Several inquiries are reported as coming from Spain, as well as some from South American countries.

Many tramp vessels nave reported at the Atlantic seaports, including New York, within the past week seeking cargoes of coal. During last month it is reported the Baltimore & Ohio R.R. handled 250,000 tons of coal for export. Reports from Pittsburgh are that a western Pennsylvania mine operator has agreed to supply 1000 tons of Youghiogheny gas coal per day for 30 days. This shipment will go to Italy.

Retailing Coal in Philadelphia

The retail dealers of Philadelphia, particularly in the industrial districts, are seriously considering the proposition of bagging coal for delivery over the counter to the customer. In some sections the bucket trade has always been a considerable factor in the retail business. Especially does this apply to the coal sold to peddlers, their purchases from the retail dealers being quite extensive. The bagging of anthracite has been brought about by the active competition of coke in this territory as a domestic fuel. The coke manufacturers have for a number of years past neatly bagged their product in strong paper bags. This method has the advantage of being cleaner and more convenient than getting coal by the bucket.

Meeting of the Kentucky Mining Institute

By J. E. Butler*

SYNOPSIS—The Kentucky Mining Institute was made a public function in which everybody took part. The necessity for the rigid regulation of first-aid meets was clearly evident both in the managing and judging of the contest.

The fourth annual meeting of the Kentucky Mining Institute was held in the center of the state's richest coal field, at Pineville, May 14 and 15. The principal features of the meet were a trip through the coal fields of Bell and Harlan Counties, an interesting discussion, and a first-aid meet in which 20 teams, representing the principal mines of Kentucky, competed.

The large attendance, the importance of the matters discussed and the number of leading mining men present made it by far the most successful meeting yet held. This success speaks volumes for the energy and foresight of the retiring president and does much credit to the work of the secretary.

The trip through Bell and Harlan Counties was made possible through the generosity of the Louisville & Nashville Ry. This road furnished without charge a special train to carry over 300 interested and interesting sightseers, including miners, operators, visitors of all kinds and their wives and sweethearts. The party left Pineville on the special train at 7 a.m., May 14, and visited many mines on Straight Creek, principally Cary and Arjay, returning to Pineville, where many more joined the excursionists, and immediately left for the plant of the Wisconsin Steel Co., at Benham.

Here W. C. Tucker, vice-president of the institute and general manager of the company, acted as host. The visitors were entertained by side trips to the store, tipple and the fine Y. M. C. A. headquarters. At Coxton the tourists stopped to see the mining operations and to partake of a most excellent luncheon prepared by the Harlan and Lock Branch coal companies and served by ladies from Coxton and Louisville.

A Few of the Operators, Miners, Their Friends and a Goodly Sprinkling of

On the evening of May 14 a banquet was given the members of the institute at the Pineville Hotel. H. La Viers, the president, acted as toastmaster. Short speeches were made by Prof. C. J. Norwood, of Lexington; Walter N. Wells, of Prestonburg; W. C. Johnston, of Pineville; W. N. Ewald, of Louisville; and White L. Moss, of Pineville.

On the morning of June 15 the annual business session was held, the principal speakers being Frank H. Cassell, sales director of the Belknap Hardware Co. of Louisville, Ky.; Senator Joe F. Bosworth, of Middlesboro, Ky.; Walter R. Peck, consulting engineer, of Stone Gap, Va.; and H. H. Small, of Chicago, Ill., the last giving an interesting talk upon the Goodman straight-face mining machines, illustrating the paper with stereopticon views.

After the reading and discussion of the papers, the following officers were elected for the ensuing year:

---

*General manager, Stearns Coal & Lumber Co., Stearns, Ky.

President, F. P. Wright, Bevier; vice-presidents, K. U. Meguire, Coxton; J. W. Cockill, Lookout; G. M. Gillette, Jenkins; J. E. Butler, Stearns; B. R. Hutchcraft, Lexington; W. G. Duncan, Jr., Greenville; T. E. Jenkins, Sturgis; secretary-treasurer, Ivan P. Tashof, Lexington. The vice-presidents retiring were: W. C. Tucker, Benham; L. B. Abbott, Jenkins; W. S. Wells, Prestonburg.

In his speech of acceptance President Wright dwelt upon the heroes of peace, calling attention to the fact that the statues in the Capitol at Washington are principally those of warriors, whose business it was to destroy and kill, and that there are practically no monuments to the great builders, the businessmen.

In the afternoon the annual first-aid contest was held on the court-house square. Twenty teams were entered, and in the absence of Major R. U. Patterson, E. B. Sutton took charge of the contest.

The teams were assigned five problems, and there being but five judges it was arranged so that five teams worked at a time and each judge had but one team to watch. From the point of view of efficient judging this was a good plan, but objectionable in that it took too long to conduct the meet. The first or one-man event took 30 min., and the fifth event was omitted for lack of time.

KENTUCKY BELLES ATTENDING THE SUMMER MEETING OF THE KENTUCKY MINING INSTITUTE

NEED FOR DRASTIC CONTEST RULES

The place for holding the contest was not well selected. Being a public square, it was practically impossible to keep spectators from crowding on the field and partisans from annoying the judges. A set of rules drawn up by some competent body, such as the American Mine Safety Association or the American Red Cross, in which it would be specified that their medals would not be awarded unless the meet was conducted in accordance with those rules, would go far in assisting first-aid committees in carrying on contests with more system and consequently with more fairness.

Physicians from the district acted as judges, and no possible criticism, only praise, can be given for the manner in which they discharged so delicate a duty. Yet this may be suggested for the benefit of first-aid in general: The work will never have the growth which it deserves, fostered alone by the contests, until the rules used by the doctors in judging are the same as those by which the teams are trained. Efficient umpiring has, more than any other single thing, made baseball the great American game.

Similarly, in this first-aid game, the doctors must follow the same rules as the first-aid men; otherwise there will always be dissatisfaction and charges of partiality. In many instances, instead of stimulating an interest in the subject, the teams return from these annual contests disheartened and resolved to have no more to do with the work. To make the knowledge of first-aid general it should be given a place in the schools, especially those of mining camps and industrial communities.

Of the 20 teams competing special mention must be given the W. G. Duncan team, which has twice successively taken first place in Kentucky contests. It is all that could be expected of such an organization—well-captained, neat in appearance, efficient in the performance of its problems. It is therefore entitled to all that it received, and may look with just pride upon its achievement of winning the second leg, and therefore full ownership, of the cup presented by Milton Sanchez, of Lexington, Ky.

The percentages obtained were as follows, the teams being listed in their appropriate order:

1. Team No. 1, W. G. Duncan Coal Co., Greenville, Ky., 98½ per cent.
2. Team No. 20, Castro team, Continental Coal Corporation, Pineville, Ky., 97¼ per cent.
3. Team No. 16, Stonega Coke & Coal Co., Big Stone Gap, Va., 97 per cent.
4. Team No. 5, Barker team No. 2, Continental Coal Corporation, 96¼ per cent.
5. Team No. 6, Stearns Coal & Lumber Co., Stearns, Ky., 96¼ per cent.
6. Team No. 10, Stonega Coke & Coal Co., Big Stone Gap, Va., 96¼ per cent.
7. Team No. 13, Pruden Coal Co., Pruden, Tenn., 96¼ per cent.

Arrival at Coxton

A Concert at Benham

8. Team No. 2, Arjay No. 1, Continental Coal Corporation, Pineville, Ky., 96 per cent.

9. Team No. 3, Wisconsin Steel Co., Benham, Ky., 95¾ per cent.

10. Team No. 11, Northeast Coal Co., Auxier, Ky., 95¼ per cent.

11. Team No. 18, Wisconsin Steel Co., Benham, Ky., 95¼ per cent.

12. Team No. 9, Pioneer Coal Co. No. 1, Kettle Island, Ky., 94¼ per cent.

13. Team No. 19, Barker No. 3 of the Continental Coal Corporation, Pineville, Ky., 94¼ per cent.

14. Team No. 12, Glendon team of the Continental Coal Corporation, Pineville, Ky., 94¼ per cent.

15. Cary team of Continental Coal Corporation, Pineville, Ky., team No. 8, 93¾ per cent.

16. Team No. 4, Northeast Coal Co., Auxier, Ky., 93¼ per cent.

17. Team No. 15, Pioneer Coal Co. No. 2 Kettle Island, Ky., 93 per cent.

18. Team No. 14, Wallsend team of the Continental Coal Corporation, 92¼ per cent.

Three Groups of Contestants at Kentucky Mining Institute Meet

In the above illustration the group on the left is the team from the Graham mine of the W. G. Duncan Coal Co., Greenville, winners of first prize. The men are J. F. Middleton, T. J. Vinson, S. E. Hite, E. E. Tanant, J. H. Spence and W. L. Cash. The team in the center is the Wallsend team of the Continental Coal Corporation. This team obtained eighteenth place. The right-hand group are the winners of the second prize from Cary, Ky., representing the Continental Coal Corporation. The men are W. Green, John P. Barton, captain; James P. Barton, C. J. Barton, J. G. Brice and L. A. Burk.

19. Team No. 7, Moss & Sons Coal Co., Pineville, Ky., 90¾ per cent.

20. Team No. 17, Arjay No. 2, Continental Coal Corporation, 87½ per cent.

It will be noted that there were several ties between the competitors. In such cases the place on the list was determined by lot.

The special prize offered by Judge W. T. Davis for the team in Bell and Harlan Counties making the highest average was won by the Castro team of the Continental Coal Corporation. It was $24 in cash.

The special prize of $15 offered by R. B. Rice for the Bell County team making the highest average was won by the Castro team of the Continental Coal Corporation.

There were also 22 other prizes awarded, 21 of these being for individual events. The prizes given at the meet were liberal both in number and value. The four events used were as follows:

Event No. 1.—A man has been struck by a fall of slate and his left ear has been torn off; there is a contused wound of his right eye and he has a lacerated scalp wound 4 in. long on the right side of his head. Treat. One-man event.

Event No. 2.—Treat burns of the face, neck, ears and hands. Two men carry patient without a stretcher. Two-man event.

Event No. 3.—Compound fracture of the left leg below the knee, involving both bones. Prepare patient to stand transportation. Two-man event.

Event No. 4.—A man has fallen on an electric wire with his back down and is found unconscious. Rescue and give him artificial respiration for one minute; treat the burns on the back and right upper arm. Improvise a stretcher and carry 50 ft. Full-team event.

The judges for the contest were Dr. C. K. Brosher, Middlesboro; Dr. L. L. Robertson, Middlesboro; Dr. Jacob Schultz, Logmont; Dr. J. B. Mason, London; Dr. L. M. Scott, Jellico, Tenn., and E. B. Sutton, of the Bureau of Mines.

A dance at the Pineville Hotel on Saturday evening brought to a close one of the most enjoyable meetings the institute has held, and the members are greatly indebted to the citizens of Pineville and vicinity and to the other leading operators in that district for their gracious hospitality. The next meeting of the institute will probably be held at Lexington.

⁂

Risk Not Assumed by Miner—A miner does not assume the risk of being injured by noxious and poisonous gases existing in his place of work, so far as the injury arises through the operator's failure to observe statutory requirements concerning ventilation, etc. (Kentucky Court of Appeals, Walls vs. Jellico Coal Mining Co., 170 Southwestern Reporter 19.)

Alabama First-Aid Meet

SYNOPSIS—First aid has taken hold of Alabama so firmly that "everybody's doing it"—miners, their wives, daughters and sons and the neighbors' boys. This describes the first state-wide meet in which 74 teams competed.

The first state-wide first-aid contest ever held in Alabama was given at Rickwood Baseball Park, Birmingham, Saturday, May 29, under the auspices of the Alabama Safety Association, the United States Bureau of Mines, the American Red Cross and the Alabama coal- and metal-mine operators.

For several months past, the United States Bureau of Mines has had W. T. Burgess, an expert in first-aid work, assisting E. B. Sutton, in charge of the Birmingham branch, and these men have been giving instructions and organizing first-aid teams in all the large coal-mining camps where teams had not already been established. So much interest was manifested in the work that a number of the companies held first-aid meets for their employees, and these soon made it evident that the time was ripe for a state-wide meet; the meeting of May 29 was the direct result.

Ladies' Teams Showed Their Skill in Bandaging at the Birmingham Meet

As soon as the decision was made to hold a state-wide meet a list of 50 possible events was published in the Birmingham papers and all the would-be contestants were advised to begin practice on them.

TEAMS WORKED ON DIFFERENT PROBLEMS

From this list of 50 events four programs of five events each were prepared on the morning of the meet, and each team was given one of the programs to carry out. Program number one follows:

Event 1: Lacerated scalp; top of the head bleeding; one-man event. Event 2: Broken left arm below elbow; two-man event. Event 3: Man's left arm and six ribs on the right side broken; treat; three-man event. Event 4: Compound fracture of left leg below the knee; bone sticking out on the inside of leg; full-team event. Event 5: Prepare, lift and load subject on stretcher (regulation or improvised), carry to and pass over obstruction to point indicated by judge; lower and unload subject.

The fifth event was the same on all the programs, and its performance enlivened the monotony of the meeting considerably, as some of the contestants so far forgot themselves as to vault over the wooden horse used as an obstruction while others deliberately walked around it after carefully passing the patient over. In addition to the four mentioned above special programs were prepared for the ladies' and boys' teams.

OVER FOUR HUNDRED PERSONS ENTERED

Seventy-nine teams were entered for the contest, and of these 74 actually reported. Thus there were 370 contestants and 74 patients. There were 4 teams of ladies, 3 of Boy Scouts, 2 of miner boys, 27 of colored miners and 38 of white miners.

The meeting was opened by a grand parade in which all the teams participated, the honors going easily to the colored men's teams because of the manner in which they kept step and their apparent unconsciousness of the spectators in the grand stand.

In the actual events of the day, the winners of the grand prizes for highest team averages were:

White men—Palos team of the Republic Iron & Steel Co., with a score of $97\frac{3}{5}$. Ladies—Wylam team of the Tennessee Coal, Iron & R.R. Co., with a score of 96. White miner boys—Sayreton team of the Republic Iron & Steel Co., with a score of $95\frac{3}{5}$. White Boy Scouts—Wylam team, Wylam Village, with a score of $97\frac{3}{5}$. Colored men—Sayreton team of the Republic Iron & Steel Co., with a score of $96\frac{3}{5}$.

The grand prizes consisted of loving cups for the teams and of medals for the individual team members. The loving cups are to be open for competition annually until won by the same team in two consecutive meets, when they become the property of the team. The medals were donated by the American Mine Safety Association and the Alabama Safety Association. There were also a large number of prizes for single events.

View of the Field with White Teams in Action

The rules governing the contest were those printed on pages 8 and 9 of the Miners' Circular 15, United States Bureau of Mines, and the list of penalties to be imposed was the same as was used at the state-wide meet in Illinois, which was published in full on p. 1030 of last week's issue.

JUDGES OVERLOOKED ERRORS ESPECIALLY IN MANNER OF WORKING

As has been the case with most first-aid meets, the judges were deserving of some criticism. They were all physicians, and with few exceptions were surgeons, but too many of them were not sufficiently familiar with the score cards to judge the events properly and as a result some of the teams were handicapped. Some of the judges also seemed to be unduly impressed by finished work, while the intention was to base the decisions on the work as it progressed.

The credit for the financial success of the meet belongs to E. B. Sutton, local representative of the Bureau of Mines; C. H. Nesbitt, Chief Mine Inspector; and Frank G. Morris, general superintendent of coal mines for the Republic Iron & Steel Co.

For the actual staging of the event W. T. Burgess of the bureau and R. E. Butler, mining engineer of the Republic Iron & Steel Co., deserve most of the credit.

The meeting lasted from 10 a.m. to 5 p.m. and during the entire day a large number of spectators were in the grand stand. The ladies' events aroused the most enthusiasm.

Woodward-Pettebone Meet

On Saturday, Aug. 14, 1915, the United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will conduct its third annual first-aid contest at Harveys Lake, Penn.

These contests were formerly held under the auspices of the Woodward and Pettebone United First-Aid Corps, but owing to the success of its former contests the organization has been extended so as to include the whole district, which consists of the following collieries: Woodward, Pettebone, Avondale, Auchincloss, Bliss, Truesdale and Loomis. These collieries employ about 10,000 persons and have 20 first-aid teams.

The prizes for adult persons employed in and around the mines in this year's contest are: First prize, $75; second prize, $50; third prize, $25. The boys' events are open only to boys employed in and around the mines, the first prize being $10 and the second $5. A prize of $10 will be given to the Boy Scouts' events, which will be open to Boy Scouts only.

Teams desiring to enter the contests should communicate with William White, foreman, Woodward mines, Kingston, Penn. Lewis Richards, 212 East Green St., Nanticoke, Penn., is secretary of the new organization.

Miners Hold Meet in Iowa

About 1000 persons met at Des Moines, Iowa, on June 6 for a first-aid meet to determine the championship of the state. The miners themselves organized the contest and placed the control under W. D. Ryan, of Kansas City, United States safety commissioner, who before he entered the Bureau of Mines was secretary and treasurer of the Illinois United Mine Workers' organization.

John P. White, president of the United Mine Workers of America, opened the program with a short address, and he was followed by Governor Clarke, who praised the accident-prevention work of the miners. Only 11 teams were present, but the movement is most promising.

In the one-man event, the Colfax team, Noah Barker, captain, scored 99⅔, and the Buxton team, Leo James, captain, scored 98⅔. In the two-man event Colfax scored 99⅓, and Hocking, John Harwood, captain, scored 98. In the team event Hocking scored 99⅓ and Mystic 97. Teams were present from the places mentioned and also from Avery, Buxton (two teams), Hiteman, Boone, Chariton and Rathbun. Two teams represented Mystic, but only one was in receipt of an award.

A captain's prize was awarded to Noah Barker, captain of the Colfax team, which made the highest number of points in the nine events. The score made was 886 points out of 900. The Colfax team received the medals of the American Mine Safety Association.

After the contests the miners organized a branch of the American Mine Safety Association, and the following officers were elected: W. H. Rodgers, Albia, president; Phil Waterman, Albia, vice-president, and Ed. Sweeney, Des Moines, secretary.

D., L. & W. Dwellings

Contracts will be let this week for 20 double houses of brick to be built for the mine workers at the Loomis colliery of the Delaware, Lackawanna & Western R.R. The houses will have modern plumbing and electric lights and will be ideally located on the slope of a hill on the Nanticoke side, west of the colliery.

The group of houses will be on high ground, and the slope of the hill will furnish natural drainage to the river. Their gabled slate roofs will be most picturesque, and they will front on a little park where tall shade trees are already growing.

The interior arrangement of the houses will be similar to that of the houses in Concrete City, the now famous model village at the Truesdale colliery of the Delaware, Lackawanna & Western R.R., each of which contains seven rooms, stationary washtubs, a buttery and a dry cellar.

Engineering Congress

An International Engineering Congress is to be held at San Francisco, Calif., under the auspices of the American Society of Civil Engineers, the American Institute of Mining Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the Society of Naval Architects and Marine Engineers. The first four organizations will meet in annual convention on Sept. 16 and 17; on Sept. 18 and 19 excursions will be made to points of engineering interest by members of the five supporting societies and the Congress, and on Sept. 20-25 the Congress itself will hold its session.

The trips on Sept. 18 will include visits to view the San Francisco high-pressure fire system, the Potrero gas works and electric station "A" of the Pacific Gas & Electric Co. and the Spring Valley water-works properties on the east side of San Francisco Bay. Other trips will be made on the following day to the Spring Valley water-works, storage reservoirs and pumping stations on the San Francisco Peninsula and the Delta Lands of the Sacramento and San Joaquin Rivers.

Also on Sept. 17 and 18 the Congress will visit the Great Western Power Co.'s hydro-electric development on the Feather River and the gold dredging at Oroville. On the 18th and 19th there will be an excursion also to the Pacific Gas and Electric Co.'s hydro-electric development at Lake Spaulding and Drum power house and to the gold mines at Grass Valley. On Sept. 17 to 19 a trip will be made by some of the members to the oil fields at Coalinga.

Excursion of the N. E. C. D. A. to Lansford

By F. R. Wadleigh*

As guests of the Lehigh Coal & Navigation Co., the New England Retail Coal Dealers' Association had an exceedingly profitable and enjoyable trip to the Delaware Watergap and Lansford, Penn.

Leaving New York on the afternoon of June 8, in a special train of seven Lackawanna cars, the party, about 280 in number, arrived at the Watergap in time for an elaborate dinner, one of the most enjoyable features of the trip. In the morning the party was taken directly to the No. 14 breaker of the Lehigh Coal & Navigation Co. This is a model of its kind, both in general appearance and mechanism, and the various processes involved in the preparation of the coal for market were viewed with interest. It seemed to be the consensus of opinion that the product of this colliery was a superior article in every way.

---

*Consulting engineer, 426 Real Estate Trust Building, Philadelphia, Penn.

From this colliery, the party was next taken to Lansford, where the boulet plant was shown in operation. This was an entirely new feature to most of the members, few of whom had ever seen anything of the kind. In view of the increasing output and use of boulets, or briquettes as they are generally called, the experiments now being made here in the use of a new binder are most interesting. The plant had been in operation for two or three years using coal-tar pitch as a binder. While this made a satisfactory product so far as structure is concerned, it was unsatisfactory in that it did not eliminate smoke. The binder now being used is crude oil, about 5 per cent. of which is thoroughly mixed with the coal as the latter is pulverized. The resulting product is waterproof, stands handling and burns without smoke.

After inspection of the boulet plant, the visitors were taken to the clubhouse of the coal company, where an excellent luncheon was provided, after which the party left for New York.

Occasions of this kind are sure to be mutually valuable to those concerned and of benefit ultimately to the consumer of coal. The officials of the Lehigh Coal & Navigation Co. and of the association are to be congratulated on the efficient manner in which the trip was conducted.

Discussion By Readers

Co-operation in Coal Industry

Letter No. 3—When reading the foreword entitled "Commissary Buying," Coal Age, May 22, p. 879, I was reminded of an unconscionable practice of certain concerns in our section of the country that are selling coal at cost and sometimes even at a loss merely because they are obtaining large profits by asking extortionate prices in their commissary departments. To such an extent have these practices been carried that the commissaries have been styled by some of the men as "Robbissaries."

The effect on the selling price of coal is similar to that referred to in the reply to an inquiry that appeared in Coal Age, Apr. 10, p. 653, under the title "Cost of Producing Coal in Iowa." It was stated there that "Correspondence with many coal operators on this point (cost of coal production) brought the statement that, while there was a loss in their coal-mining business proper, this was more than counterbalanced by the profits from selling merchandise and renting houses."

As a protest against such practices, I desire to submit the following comments and to urge what has already been argued ably in Coal Age by Carl Scholz, May 1, p. 777; namely, more coöperation on the part of coal operators. I recall an instance of a coal company that for several years accepted a railroad contract that netted only the cost of production, which they were enabled to do because of the large profits realized in the commissary department by selling supplies to the miners who worked in their mines. Another concern had a large rent-roll, in addition to big returns from the commissary department resulting from extortionate prices asked for goods sold to employees, which enabled them also to market their coal at the simple cost of production.

A brief reference to the principles involved in these methods of conducting a coal business will show clearly that they are unsound and unjustifiable by the recognized rules of business. For example, one of the corporations referred to above, in the development of its business, made a large investment in coal land adjoining its property, for which it was obliged to pay what might be considered a fabulous price. In addition to that it spent a considerable sum in the installation of a large plant equipped with the latest machinery. In so doing it incurred the risk of losing the entire investment, because it adopted no measures of protection against unforeseen accidents or losses. It established no reserve fund of any kind, paid no royalty to itself for the coal extracted—in other words, set aside no sinking fund—and charged off nothing for depreciation and interest.

To illustrate this condition, suppose one invested in bank stock. What would he think if the cashier or management said to the tenants of the bank's office building, "We will only charge you sufficient rental to pay taxes on the building, since we derive an income from the interest on our loans?" Or suppose the bank loaned money for nothing, because the office building was earning a good rental; or suppose the money was loaned without security, thereby incurring the risk of losing the entire amount. Would any sane business man want to purchase stock in that bank?

It is clear that it is time for the coal industry to get down to a solid basis for conducting its coal operations and to adopt an equitable system of merchandising and of renting houses to employees. Each of these departments of business should be conducted on a safe and independent basis, as anything else is ruinous to the coal industry. When this is done, and every operation is earning a reasonable profit, coal mining securities will become gilt-edged instead of "guilt-edged."

General Manager.

——, Ky.

Labor in Mining

Letter No. 5—No little temerity is required to answer the question of Mr. Le Baron, Coal Age, May 22, p. 896, asking a reason for the necessity of strikes in the coal industry. While I may run some risk in attempting to comment on the conditions that suggested this question, I cannot refrain from expressing the thoughts that come to me in this connection.

I am inclined to doubt that this question is asked because the inquirer has no positive convictions in reference to the subject on which he desires to be informed. I believe that he, like many others, has asked the question for the purpose of inviting its discussion by men acquainted with practical conditions affecting the coal industry.

As a first statement I want to say that, in my opinion, strikes are *not* necessary. I realize, however, that a statement of this kind requires some qualification. To my mind, a strike expresses a stupidity that is not confined to any one side of the controversy. It should be plainly manifest to the thoughtful mind that a strike, from any cause, is expressive of a condition bordering on chaos.

How can we claim that our civilization is progressive and that we are attaining—both employers and employed—to higher ideals and standards when it is possible to exchange at a moment harmonious working conditions for those of chaos and idleness? Organization, either of capital or labor, fails of its true object when a clash of conditions affecting the interests of the parties to the controversy causes them to show their teeth and fight like cats and dogs or, even worse, leads them to have recourse to deadly weapons to settle a dispute.

Political economists claim that strikes are the result of a class war; that the interests of employer and employed are antagonistic to one another, and a strike is the natural manifestation of such existing antagonism. We claim to be civilized, but what we need today is *peace,* not *war*. We must set up the standard that strikes are unnecessary and can be entirely eliminated by cultivating a proper feeling of regard and consideration for each other. While some may argue that, if the principle of collective bargaining fails, a strike is necessary to enforce one's demands, it should be remembered that there are other ways of obtaining concessions than by striking. There should be no difficulty in adjusting reasonable demands when the parties are willing to recognize each other's rights.

I recall an incident that occurred some years ago while I was a member of the Miners' Union. The members of the local union made an unreasonable demand and, against the wishes and orders of their executive officers, voted to strike. The result was what might have been expected, and the men were compelled to return to work under worse conditions than before. They not only failed to realize any benefit, but sacrificed the confidence and esteem of their employers. I want to suggest that the remedy for such a state of affairs is to be found in *arbitration*.

A few years ago New South Wales was a hot-bed for strikes. They occurred so frequently that miners who emigrated from Europe came to America rather than start work in that country. Time has largely eradicated the strike evil in that section, and strikes are fast becoming a thing of the past. This was accomplished by means of courts of arbitration, and as a result no strikes occur from any insignificant cause. Both employers and employed have discovered a better way, and chaos has been succeeded by a tribunal of common sense, which tribunal is composed of miners, operators and others whose interests are neutral.

Under these conditions, brains and intelligence have accomplished more than could possibly be obtained through a strike. Permit me to suggest that if we emulate this example, turmoil in the coal industry in this country will soon be a thing of the past. We might well heed the old Bible injunction that carried conviction to the heart of the questioner when his own answer brought the solemn rejoinder, "Go thou and do likewise." We can often admire in another what we fail to adopt as our own standard of action. Strike is a habit as illogical as the drink habit.

WILLIAM CROOKS.

Ensley, Ala.

Letter No. 6—Mr. Le Baron's question asking why strikes are necessary in the coal industry, COAL AGE, May 22, p. 896, is liable to bring forth a number of interesting letters in response. The strike problem is one of such tremendous importance and so far-reaching in its effects that it seems absurd to think that any one person could find a solution. Yet if one can but suggest something that will prove beneficial to a single phase of this vexed problem, some good will be done.

In the early days of mining when larger profits were realized by coal operators it was easy for the mine worker to think that his wages were not commensurate with the profits earned by the company that employed him. His hours were long and the major portion of his wages were absorbed by necessary purchases in the company store. These and other objectionable features, however, can hardly be considered as correctly revealing the underlying causes of strikes by organized labor at the present time.

There is apparently a break in the clouds, and it is possible that the miners are at last realizing that the goose that laid the golden egg is about to expire. The Ohio mine strike of 13½ months illustrates forcibly the futility of attempting to extract unreasonable demands from corporations. The fact that corporations are often wealthy—and there are, at times, indications that they are disorganized—offers no particular advantage or hope of success for strikers.

Although the demands by Ohio miners for 47c. per ton for run-of-mine coal were granted by the operators, it was a defeat for the miners, who were obliged to relinquish many privileges in addition to the loss of work for more than a year. The outlook indicates that weeks or even months may elapse before it will be possible for operators in the No. 8 seam to recover the volume of business that was theirs previous to the strike. This means irregular work and loss of income for the miner for some time to come. The question is also raised in regard to what effect the run-of-mine system will have on the marketing of the coal from the No. 8 seam.

The high cost of living certainly presents a difficult problem for the miner, who is dependent on his daily work. But the solution is not to be found in attempting to gain further concessions from the operators. There must be unity of action, coöperation and the forgetting of differences, which I admit is a difficult matter, but is nevertheless necessary for the general good of the coal industry and the personal welfare of mine workers.

In referring to "a break in the clouds," I had in mind the action of the miners' organization in using its influence with the Ohio legislature to secure an investigation of the alleged discrimination in freight rates, which operated directly against the interests of Ohio miners. Although this move may have been actuated by selfish motives it must be admitted that it had an important bearing on the settlement of the differences existing between operators and miners. In other words, it was an act of coöperation working for the common interests of both parties and is to be commended.

No doubt Mr. Le Baron is mostly concerned in the effect this incessant turmoil may have on the future of the coal industry. For a long time I have thought this question should be carefully considered and discussed, in the hope that suggestions might be made that would mark a red-letter day for the industry of coal mining.

In looking for possible remedies, it is necessary to study the causes that led to the present conditions. Chief among these is the unrestricted and ruinous competition in the selling of coal. This has already been discussed in COAL AGE; and, as has been suggested, the remedy is a closer affiliation in the selling end of the coal industry. This, however, has been found to be opposed by the anti-trust-law bugaboo. I would ask, Could not a commission be appointed with power to regulate and allow certain combinations that appear necessary for industrial harmony and success? This is particularly necessary in the coal industry. The work should be under Government supervision to prevent any combination in restraint of trade.

Another cause is freight-rate discrimination, which at present is receiving careful consideration and will no doubt be improved rapidly, with justice to the railroads and all shippers of coal. I will only mention one other cause of the strike turmoil. This is the natural spirit of antagonism between capital and labor. The only remedy for this is the ability to put one's self in the other fellow's place—Capital to understand that Labor must have living wages and conditions, and Labor to understand that there are limitations in the conduct of all business beyond which Capital cannot venture without certain destruction that will carry Labor with it in its downfall. The remedy for this condition is well understood to be impartial arbitration and the cultivation of the get-together spirit.

Oklahoma Consolidated Coal Co.

Henryetta, Okla.

⁂

Reducing Ventilation When Firing

I know this subject was discussed in the columns of Coal Age quite thoroughly some time ago, without, however, accomplishing the results that might be desired. It would naturally be expected that the discussion of a matter that plays so important a part in the prevention of mine explosions would have been given some attention by the Federal Bureau of Mines and that the suggestions made by so many practical mining men would have been investigated.

It will be remembered by the readers of Coal Age that C. W. Waterman, general superintendent of the Fleming Coal Co., Pittsburg, Kan., two years ago extended a cordial invitation to the Bureau of Mines to visit the mines of the company and make the necessary investigation called for by this question.

Again, I met some of the employees of the Bureau of Mines during the past winter and tried to prevail on them to visit the mines and investigate the conditions prevailing in them in respect to ventilation, gas and dust. This, however, was without avail. I feel that if the bureau will not take the matter up and investigate, it should retract its statement that the still-air theory is wrong in reference to the prevention of mine explosions. My claim is that the sealing of the upcast shaft of a mine and the stoppage of all circulation of air in the mine airways and workings successfully prevent the development of an explosion in the mine under the most aggravating conditions.

According to the report of the discussion of this subject by the mine inspectors at their annual meeting at Birmingham, Ala., June, 1913, as published in Coal Age, Vol. 5, p. 125, Mr. Paul, mining engineer of the Bureau of Mines, seems to question my veracity in respect to the statement I made, Coal Age, Vol. 3, p. 25, that "I found in the center of a main south entry a small tunnel (of air) formed by the rush of air through the gas-filled mine." Mr. Paul is quoted as saying, "In all my experience in mine explosions I have never found a column of pure air so located, or air in the center of an entry which varied from the air against the roof or on the bottom." I would like to ask Mr. Paul a question: Suppose an entry open at both ends is filled with afterdamp and a current of air is forced into this entry under pressure, will not the air current force a passage for itself through the center of the entry along the line of least resistance rather than travel along the roof, floor or sides of the passageway?

Mr. Verner in commenting on this point, Coal Age, Vol. 5, p. 218, remarks that his experience has been similar to mine. Permit me to say that I have entered mines on 14 different occasions inside of 30 min. after explosions have occurred, and in every instance I have found that natural ventilation has set in, regardless of whether the fan was still working. The experience that Mr. Paul questions occurred immediately following the explosion in mine No. 15 of the Western Coal & Mining Co., Dec. 21, 1907. I was the mine foreman at the time. I have given a full account of this experience in Coal Age, Vol. 3, p. 24, which need not be repeated here.

In closing, permit me to say that during the past two years some of our coal companies have installed sprinkling and humidifying systems in their mines and have refused to seal up the upcast shaft, with the result that explosions have occurred in nearly all of these mines, with the loss of many lives. They subsequently sealed the mines and abandoned their sprinkling and humidifying operations, with better results. Our own mines have been sealed in this manner for over 18 months, and we have had no trouble. The mines generate much gas, over 7 per cent. of the working places being marked up each day by the firebosses. There is also plenty of coal dust, and each night over a ton and a half of blasting powder is exploded within two hours' time. In this practice we have never had any trouble. I desire again to invite Mr. Paul, of the Bureau of Mines, to visit our mines and allow me to prove to him that the still-air theory is correct.

Alexander McAlister.

Girard, Kan.

⁂

Dry Air for Rock Drills

Referring to the article entitled "Driving Rock Tunnels in a Utah Mine," Coal Age, Feb. 13, p. 278, I desire to offer a few comments on the reference there made to the avoidance of the freezing-up trouble when using compressed air.

The installation described in this article offers an excellent illustration of the correct solution of the trouble arising from freezing due to the humidity of the air compressed. The conclusions of the writer, however, appear to be based on a misunderstanding of conditions that is altogether too prevalent in the employment of compressed air for power purposes. It is freely admitted that the facts as stated are correct in every detail, but the good results obtained and the absence of any trouble from freezing are not due to the location of the compressor outside of the mine. These two facts bear no relation to each other as cause and effect.

The records of installations show that there are hundreds of compressors located outside of mines and tunnels, while the same trouble from freezing of the air is experienced at the working face where the power is used. The statement was made in the article to which I have referred that "The compressors were placed outside the mine mainly to insure getting dry air, as the atmosphere inside the mine contained a large amount of moisture."

It is well to remember that there is no such thing as dry atmospheric or free air. The expression "dry air" is only relative. According to the U. S. Weather Bureau, the average humidity of the air at various places is as follows: Galveston, 85 per cent.; New York City, 73 per cent.; Salt Lake City, 53 per cent.; etc.

As is well known, the moisture of the air is a perfectly transparent and invisible vapor, until the humidity reaches 100 per cent. or the point of saturation is attained, when the moisture begins to condense and separates from the air as water, which may appear as a fog or mist. This condensed vapor, however, accumulates on the walls of the pipe and trickles down, forming a stream that drains along the pipe line, following the air to the point of exhaust where it is frozen owing to the cold produced by the expansion of the exhaust air, which absorbs the heat from all around.

The point of saturation of the air, or the "dew point," varies with the pressure and the temperature of the air. For example, assume the air entering a compressor contains a certain weight of moisture per cubic foot of air. When this air is compressed to two, three or four atmospheres, its volume is reduced one-half, one-third or one-fourth of the original volume, and since the weight of moisture remains unchanged, the degree of humidity is increased in proportion to the number of atmospheres to which the air is compressed, provided the temperature remains constant.

This, however, is not the case, since the compression of the air causes a rapid rise of temperature. Practically, each rise of 20 or 25 deg. F. doubles the capacity of the air for holding moisture and decreases its relative humidity at the same rate. As a result, the air leaving the cylinder of the compressor is comparatively dry air, although carrying the same weight of moisture as when it entered the compressor.

Bearing these facts in mind, it is clear that, owing to the high temperature and low humidity of the air, little water will collect in the receiver when this is placed near the compressor. On the other hand, the temperature of the air after flowing through a long pipe line is greatly decreased, and as a result the air becomes completely saturated before reaching the working face. It is clear, therefore, that there is a great advantage to be gained by placing a receiver at the end of a pipe line or where the power is used, so as to allow the water to collect at that point and be drawn off without being forced into the air cylinders of the tools. In the present case the air was carried through a 4-in. pipe line 3725 ft. long, which insured its thorough cooling and gave favorable results.

FRANK RICHARDS.

New York City.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Composition of Gases—Gas, like other material substances, is composed of the elements of matter. A **simple** or **elementary gas** is composed wholly of one kind of matter; as hydrogen (H), oxygen (O), nitrogen (N), etc.

Many gases, like many solids and liquids, are **compound.** The molecule of such a gas is formed by the chemical union of two or more atoms of different elements; as methane (CH_4), carbon monoxide (CO), carbon dioxide (CO_2), etc.

A **gaseous mixture** is a mechanical mixture of different gases, simple or compound. These gases are mixed together in any proportion, but are not chemically united.

Firedamp is a mechanical mixture of a combustible gas or gases with air in such proportions as to render the mixture inflammable or explosive. The term, however, is generally understood to mean an inflammable or explosive mixture of methane (CH_4) and air. In English and other foreign textbooks the term "firedamp" is improperly applied to any mixture of explosive gas and air, without regard to whether the proportions are within the inflammable or explosive limits of the gas. Such a mixture will not inflame or explode and is not, properly speaking, a firedamp mixture.

Percentage Composition of Gases—By the "percentage composition" of a compound gas is generally meant the percentage, by weight, of each element composing the gas. This is calculated from the ratio of the relative weight of each constituent element to the molecular weight of the gas.

For example, a **molecule of methane** (CH_4) contains one atom of carbon and four atoms of hydrogen. Then, since the atomic weight of carbon is 12 and that of hydrogen 1, the molecular weight of methane is 12 + (4 × 1) = 16, and the percentage composition of this gas is calculated as follows:

Carbon (C); atomic weight, 12; relative weight.......... 12
Hydrogen (H_4); atomic weight, 1; relative weight, 4 × 1 = 4

Molecular weight of gas.................... 16

The percentage of each constituent element is then:

Carbon, 12/16 (100) = 75 per cent.
Hydrogen, 4/16 (100) = 25 per cent.

100 per cent.

In like manner, a **molecule of carbon dioxide** (CO_2) contains one atom of carbon and two atoms of oxygen. The atomic weight of carbon being 12 and that of oxygen 16, the molecular weight of carbon dioxide is 12 + (2 × 16) = 44 and the percentage composition of the gas is found as follows:

Carbon (C); atomic weight, 12; relative weight.......... 12
Oxygen (O_2); atomic weight, 16; relative weight, 2 × 16 = 32

Molecular weight of gas.................... 44

The percentage composition is then:

Carbon, 12/44 (100) = 27.27 per cent.
Oxygen, 32/44 (100) = 72.73 per cent.

100.00 per cent.

The term "percentage composition" when applied to a gaseous mixture refers to the **percentage by volume** of the several gases forming the mixture.

The Coal Age Pocket Book

Composition of Air—Normal air is composed chiefly of oxygen and nitrogen, which are invariably mixed in the following proportions expressed as percentage by volume and by weight of each of these gases:

TABLE SHOWING COMPOSITION OF NORMAL AIR

	By Volume	By Weight
Oxygen..............	20.9 per cent.	23.0 per cent.
Nitrogen............	79.1 per cent.	77.0 per cent.
	100.0	100.0

Air also contains 0.04 per cent. of carbon dioxide (CO_2), together with smaller amounts of argon, ammonia and water vapor. Atmospheric air, it may be said, is never absolutely dry or free of moisture. The term **"dry air"** in respect to the atmosphere is only a relative expression, meaning that such air is comparatively dry.

Weight of Dry Air—The weight of dry air, per unit volume, varies directly with the pressure it supports, and inversely as its absolute temperature. There are two formulas for finding the weight of 1 cu.ft. of air, one being expressed in terms of the barometer (B), in inches, and the other in terms of the pressure (p) in pounds per square inch.

By the barometer, $$w = \frac{1.3273\,B}{460 + t}$$

By the pressure, $$w = \frac{p}{0.37\,(460 + t)}$$

Moisture in Air—This subject is fully treated under "Hygrometry," and it is sufficient here to say that the water absorbed or held by the air is an invisible vapor that resembles a gas in its behavior, until a sufficient amount is present to fully saturate the space it occupies. This point of saturation is called the **"dew point,"** because at such point the vapor begins to condense and appears as a mist or cloud. The condensation is more rapid in contact with a cold surface.

Normal Air—The term "normal air" in respect to its composition refers to air containing a normal percentage of oxygen (20.9 per cent.) as given above. When the percentage of oxygen present is less than normal the air is said to be "depleted" of its oxygen. This frequently occurs in poorly ventilated places in mines. The depletion of oxygen is the result of the various forms of combustion or oxidation that are constantly taking place in mines, and very largely, also, to the absorption of oxygen from the air by the coal.

Mine Air—Except when diluted with other gases, the air in a well-ventilated mine never shows any appreciable depletion of its oxygen content. Even in poorly ventilated places it is exceptional to find less than 20 per cent. of oxygen, except where other gases are being generated in considerable volume whereby the air is diluted and the percentage of oxygen correspondingly diminished. This fact has been well established by innumerable tests of mine air made at different mines and under varying conditions of ventilation.

Inquiries of General Interest

Value of Coal Analyses

I want to ask, What is the use of keeping men busily employed all over the country determining the heat value of coal? In my opinion, such work is a pure loss of time and energy.

I freely admit that it is well for the purchaser of coal to know its heat value; but when this is obtained, I can see no use in continuing to make similar tests, day after day, of coal delivered from the same mine and operating on the same contract. These tests show approximately the same value, and their constant repetition adds to the operating expense and increases the cost of production.

It is readily seen that this is no small item when one reflects that the accurate apparatus employed requires an investment of approximately $2500 at the start, to say nothing of the cost of maintenance and the material used, together with the additional office expense and salaries. It is a common thing to hear complaints made in relation to the increasing cost of testing coal offered on the market, and these complaints are fully justified. This cost oftentimes more than counterbalances the saving effected thereby in the purchase of coal having the highest heat value.

In my opinion the solution of the problem is to be found in leaving the determination of the heat value of the coal to the mine operator. Mine operators are not always the band of crooks so often claimed. I believe them to be as honest as the average manufacturer.

Under the present system, I cannot blame coal operators for foisting a poor quality of coal upon the buyer whose slogan is generally, "I'll dare you to sell me poor coal—you can't do it." Facing such an imputation of dishonesty, it is not strange that the quality of the coal delivered frequently falls short of the standard required. Would it not be better to use coal experts in a more useful way. For example, employ them to show how fuel can be saved by securing greater efficiency in power plants and a more complete combustion of the coal.

N. G. NEAR.

New York City.

[We hope to have this question fully discussed in the next issue of COAL AGE, by one whose practical knowledge and experience make his remarks of value to shippers and buyers of coal.—EDITOR.]

⁂

Mine Ventilation Problem

Will you kindly answer the following question in regard to the effect produced by enlarging the sectional area of an airway in a mine. In this case, the entire length of the air course including the return remains unchanged. The original cross-section of the airway is 4x9 ft., making 36 sq.ft. of sectional area.

In order to obtain a greater volume of air in circulation, it was proposed to increase this area to 45 sq.ft. by taking down 12 in. of roof slate, thus making the sectional area of the enlarged airway 5x9 ft. This work was started from the intake and carried forward to within a short distance of the return end of the air course. Kindly show by calculation what effect this will have on the circulation of the air, assuming the power on the air remains unchanged.

MICHAEL LOBUONO.

Hooversville, Penn.

In order to answer this question, it is necessary to assume a certain definite length of air course, say 5000 ft. including the return. Assume, also, that the sectional area of the airway was enlarged, as stated, for a distance of 4500 ft., or to within 500 ft. of the discharge.

Since the power is the same in each case, it is necessary to first find the power potential of the original air course and that of each of the two sections of the airway after the work of enlarging the area was stopped. Calling the original airway and the two sections of the enlarged airway A, B and C respectively, the sectional areas and perimeters in each case are as follows:

A, $a = 4 \times 9 = 36$ sq.ft.; $o = 2(4 + 9) = 26$ ft.
B, $a = 5 \times 9 = 45$ sq.ft.; $o = 2(5 + 9) = 28$ ft.
C, (same as A)

The relative power potentials are then

$$\text{A,} \qquad X_a = \frac{a}{\sqrt[3]{lo}} = \frac{36}{\sqrt[3]{5000 \times 26}} = 0.711$$

$$\text{B,} \qquad X_b = \frac{45}{\sqrt[3]{4500 \times 28}} = 0.898$$

$$\text{C,} \qquad X_c = \frac{36}{\sqrt[3]{500 \times 26}} = 1.531$$

In comparing the circulation of air before and after the work of enlargement is done, the ratio of the increased circulation to the original volume of air passing is given by the following formula:

$$\frac{Q_2}{Q_1} = \frac{X_b X_c}{X_a \sqrt[3]{X_b^3 + X_c^3}}$$

Then, substituting the given values in this formula,

$$\frac{Q_2}{Q_1} = \frac{0.898 \times 1.531}{0.711 \sqrt[3]{0.898^3 + 1.531^3}} = 1.188$$

That is to say, the increased circulation is 1.188 times the original volume of air. In other words, the increase of volume in this case is 18.8 per cent. of the original quantity.

Had the work of enlarging the airway been carried the entire distance, the circulation for the same power on the air would have been increased 22 per cent., as shown by the following simple calculation:

$$\frac{Q_2}{Q_1} = \frac{a_2}{a_1} \sqrt[3]{\frac{o_1}{o_2}} = \frac{45}{36} \sqrt{\frac{26}{28}} = \frac{5}{4} \sqrt[3]{0.928} = 1.22$$

Comparing this result with the previous one shows that a larger percentage of benefit is derived in the later stages of the work. This question, although difficult of solution, has a practical bearing on mine ventilation and illustrates the value of the potential method.

Examination Questions

Miscellaneous Questions

(*Answered by Request*)

Ques.—What must be the sectional area of a square airway that is required to pass 50,000 cu.ft. of air per min. under a water gage of 1 in., the length of the airway, including the return, being 1 mi.?

Ans.—Let d equal one side of the square airway. Then, since 1 mi. equals 5280 ft., and 1 in. of water gage corresponds to a pressure of 5.2 lb. per sq.ft., and using the coefficient of friction, $k = 0.00000001$, the side of the airway required in this case is

$$d = \sqrt[5]{\frac{0.00000001 \times 5280 \times 4 \times 50{,}000^2}{5.2}} = say\ 10\ ft.$$

The sectional area of this airway is, then, $10 \times 10 = 100$ sq.ft.

Ques.—At a certain mine there is installed a ventilating fan operated by an electric motor. The fan is producing 300,000 cu.ft. of air per min. against a water gage of 4.2 in. The wattmeter registers 145 kw. for each of the two motors operating the fan or a total of 290 kw. in the fanhouse. At the power plant, 1 mi. from the house, the meter registers 330 kw. What is the mechanical efficiency of the fan, 1 hp. being equal to 0.746 kilowatt?

Ans.—The power on the air, in this case, is

$$H = \frac{300{,}000 \times 5.2 \times 4.2}{33{,}000} = 198.5\ hp.$$

The efficiency of the ventilator is equal to the ratio of the power on the air to the power delivered to the fan shaft, which may be assumed to be 90 per cent. of the power delivered to the motors, or $(0.90 \times 290) \div 0.746 =$ say 350 hp. The efficiency of the ventilator is, then, $198.5 \times 100 \div 350 = 56.7$ per cent.

Ques.—What percentage of firedamp when mixed with air is necessary (a) to show a faint cap; (b) to readily explode; (c) to be at its most explosive point?

Ans.—Assume that the firedamp is a simple mixture of marsh gas and air, and that no dust is present.

(a) When using an unbonneted Davy lamp burning sperm or cottonseed oil, the first faint cap should be observed when the proportion of gas is from 2 to 2½ per cent. of the mixture, depending on the ability of the observer to detect the cap.

(b) The lower explosive limit of the mixture, under the assumed conditions, will occur when there is 7.14 per cent. of gas present.

(c) The firedamp mixture reaches its maximum explosive point when the gas forms 9.46 per cent. of the mixture.

Ques.—What are the necessary supplies that should always be on hand at a mine, for the safe working of the same, and what is your duty in the case when your supplies are not on hand when needed?

Ans.—Besides the usual supplies of timber, tracking, brattice boards and cloth, hardware, tools, powder, oil, hay, etc., there should be kept on hand a complete "first-aid" outfit, including two or more sets of breathing apparatus, a pulmotor, oxygen tanks filled with this gas and an adequate supply of safety lamps of approved pattern. The mine equipment should also include a suitable conveyance to be used as an ambulance and two or more stretchers, blankets and waterproof coverings. In case any of these supplies have run out, it is the mine foreman's duty to at once notify the superintendent or order himself what is required.

Ques.—Explain fully the different methods of mine ventilation. Describe the continuous and split systems of ventilation. Which do you prefer and what are its advantages and disadvantages?

Ans.—The two general systems of ventilation employed in mining are the *exhaust* and the *blower* systems. In the exhaust system of ventilation, some means are employed to create a depression in the main-return airway, so that the pressure at that point is below that of the atmosphere. The excess of the atmospheric pressure at the intake opening of the mine then forces the outside air into and through the mine. In this system the mine is ventilated under a pressure *below* that of the outside atmosphere.

In the blowing system of ventilation some means are adopted to create a pressure in the main-intake airway greater than that of the outside atmosphere. This excess of pressure in the intake forces the entering air through the mine airways.

Furnace ventilation belongs to the exhaust system, while fan ventilation may be either by the exhaust or the blowing system, according to the arrangement of the fan and its connection with the mine.

A continuous air current is one that passes through the mine from the *intake* to the *discharge* opening, in a single undivided current. In splitting, the air current is divided at one or more points in its passage through the mine, which is thus separated into two or more ventilation districts, each having its own air split or current. The split system is much to be preferred, as it provides better air at the working face and a larger quantity of air is circulated by the same power, while the velocity of the air in the workings is such as to cause no annoyance or danger. Also, the gases generated in one section of the mine are conducted immediately into the main-return airway, without passing into other sections. These are the principal advantages of the split system of ventilation. The system has no disadvantages except, it may be, the necessity of providing air crossings at the mouths of the several splits.

Ques.—If it is necessary to double the quantity of air passing in a mine, how much should the pressure and power be increased, assuming mine conditions are unchanged?

Ans.—To double the quantity of air passing in a mine will require four times the pressure and eight times the power on the air, under the assumed conditions.

Coal and Coke News

Washington, D. C.

Probably the most significant event of the past few weeks in a business way is considered here to have been the hearings conducted by the Federal Trade Commission in Boston and New York. The completion of the sessions for the time being has given observers opportunity to take some account of stock and make up their minds in which direction the work of the Commission is pointing. What is thus indicated is likely to be of much importance not only during the next few months but also as determining the direction of events after the opening of the next session of Congress when the question as to whether more legislation on the trust issue either in its domestic or foreign aspects or both is taken up for decision.

While the hearings in question have dealt largely with matters of chief interest to producers of manufactured goods, specialties of various kinds, and the like, much of the testimony has also had an important bearing upon the development of export trade in staple articles in bulk such as coal, metals and similar commodities. Of particular interest in this connection, to the coal industry, was the showing made as to the advantage of foreign trade. This is seen mainly in the fact that foreign trade permits stability in production, fluctuations of domestic and foreign demand frequently or usually offsetting one another.

In order to get the organization needed for the efficient and economical organization of foreign trade it was urged that some form of coöperation or combination in such trade should be allowed to exporters, certainly to the smaller concerns. The problem usually met when such suggestions are made—that the line between large and small cannot easily be drawn in a satisfactory manner—presented itself, but there was no consensus of views on the subject. Some of the larger concerns, moreover, directly testified that they themselves felt comparatively little interest in the situation as they would in any event feel compelled to maintain their own selling organization.

There was a particularly strong demand for a clearer interpretation of the meaning of the anti-trust laws, especially in their application to export trade in order that shippers may know exactly what is permitted in carrying on business and that doubt with regard to given methods may be eliminated.

There was also the usual criticism of existing transportation means, complaint being particularly expressed with regard to the service between the United States and South American ports. There was, however, difference of opinion regarding the proper methods to be employed for improving the situation.

Closer Relations with South America Sought

The outcome of the Pan-American financial conference seems likely to be the holding of regular conferences of the same sort either in Washington or at some point in South America or both. Annual conferences are spoken of, though definite plans for them are still to be developed. It is proposed that a session of the "International High Commission" recommended by the conference be held at the beginning of November next, probably in Buenos Aires.

At this session it is proposed to have discussion of questions of uniform legislation for the several countries resulting presumably in the recommending of measures to the various legislative bodies that would have to act upon them. Among other matters interesting to exporters which are likely to have attention in this connection is the shipping problem, it having been resolved by the recent Conference in Washington that better vessel facilities are necessary and that effort should be made at the earliest possible moment for the provision of such improved facilities in order to secure better opportunities for sale or products and more assured delivery as well as better financial relations between North and South America.

PENNSYLVANIA

Anthracite

Olyphant—Five years ago James H. Rolles, who has spent his entire life in work around mines in the vicinity of Scranton, became convinced that the coal measures extended up the side of the mountain west of Olyphant. He secured a lease of an old mine opening and the right to take out what coal remained. While mining in the old workings he prospected the surrounding land. Early this year bore holes revealed two veins of coal, one 5 ft. thick and the other about three. Assuring himself that the coal extended over the entire tract, he acquired a lease, and proposes to begin mining.

Delaware Watergap—A large party of New England coal dealers was here several days recently on a sight-seeing tour as the guests of the Lehigh Coal & Navigation Co. Later the party went to the Panther Creek Valley to view the extensive coal fields of the above company, together with the enormous new power plant at Hauto.

Mauch Chunk—Quite a number of cars of coal are being taken daily from the waters of the Lehigh River in the dams here and at Parryville, Lehigh Gap and Treichler. Each summer the dredging of coal furnishes lucrative occupation for a number of men in this and other Lehigh Valley towns.

Lansford—Idle for more than a month the large Hauto washery of the Lehigh Coal & Navigation Co. has resumed operation.

Carbondale—At an estimated expense of about $125,000 the Delaware & Hudson Co. is constructing a coal storage plant at Duffy's Field about a mile and a half from Carbondale. This plant will have a capacity of about 170,000 tons. The purpose of this storge plant is to store coal when the demand is light during the summer months. Various sizes are placed on storage and remain there until such time as the demand increases.

Bituminous

Connellsville—The Connellsville coke region recently shipped 321,000 tons of coke in one week, the increase was caused by shipments to Baltimore and Philadelphia for export to Australia and South America. Production during the same week was approximately 315,000 tons.

Preparations are being made to fire 1000 coke ovens operated by the H. C. Frick Coke Co. in the Connellsville district.

Star Junction—Announcement has been made by the Washington Coal & Coke Co. that it needs 100 additional diggers. The company now has 700 of its 1000 ovens in operation.

Greensburg—Chief Burgess John L. Shields is seeking some legal way to prevent property owners from selling the coal under city property. Recently representatives of a large coal company obtained mining rights to the coal under certain lots. Sales of this sort have become so numerous that the business men have become alarmed. The coal under the town is of coking quality, and no other coal field in the country is so noted for caving as this, once the coal is mined out. In all the country around Mount Pleasant holes can be seen where the coal has been removed and ground has caved.

Washington—The Youghiogheny-Pittsburgh Coal Co. has filed an injunction against the United Mine Workers of America, naming Van Bittner, president of sub-district No. 5, and Robert Wood, an officer of that district, to enjoin the organization from declaring a strike. The strike in question occurred on June 1, when the miners were called out of the mine of the company.

Pittsburgh—Reports of a shortage of labor have emanated recently from many points in the bituminous field of Pennsylvania. This decrease in supply was laid to the fact of a considerable number of aliens responding to the call for military duty in Europe. However, an investigation of emigration statistics does not bear out this belief. While it may in some measure account for a deficiency the real reason probably will be found in the decrease of immigration, which has at this time almost reached the vanishing point. Instead of the normal weekly influx of one thousand men, immigration has now practically ceased.

Johnstown—After hearing over a score of witnesses the coronor's jury empaneled to take testimony in the case of the accident that cost the loss of nine lives in the explosion at No. 1 mine of the Smokeless Coal Co., rendered a verdict placing the blame on the officials, declaring the accident could have been avoided if safety lamps had been in use, as recommended some time before the explosion by the mining inspector. The jury also took occasion to laud the heroism of Gomer Phillips, one of the men who lost his life in an attempt at rescue.

WEST VIRGINIA

Charleston—Chief of the Department of Mines, Earl A. Henry, was recently notified that another body had been found in the Layland mine, in which a mine explosion early in March, killed something over 100 men. Every person supposed to have been in the mine at the time of the disaster had been accounted for, and it is possible that the identity of this victim will never be known, as the body was so badly decomposed that identification was impossible. As the section where the body was found was flooded, it was thought that this man stumbled into the water and was drowned. It is believed that the body was submerged when a rescue party explored that region.

VIRGINIA

Norton—The power house of the Norton Coke & Coal Co. was completely destroyed by fire recently. The origin of the fire has not been ascertained, but the loss was estimated as $25,000. The operation of the mine was suspended, but officials of the company made arrangements with the Norton Light & Power Co. to furnish light and power until the coal company's plant could be rebuilt. It is said that immediate steps are being taken to rebuild this plant.

KENTUCKY

Hazard—The Hazard Coal Co. is installing a new boiler to supplement the 400 hp. of the present equipment. The mines are running full time and putting out a capacity production.

Frankfort—A special term of the Federal District Court has been held here to hear evidence in the case of the Virginia Iron, Coal & Coke Co. against Alexander Webb, T. Beekman Hawkins and the Eversole heirs, by which it is sought to quiet the title to 900 acres of coal lands in Perry County.

Central City—Resolutions condemning outrages which have transpired in Muhlenberg County and calling on the friends of organized labor to refrain from violence of any character, were adopted by the United Mine Workers of America, District 23, at a meeting held here recently. The resolutions set forth that the raids, etc., are more or less generally attributed to friends of union labor, that they are endangering the very life of the organization in Muhlenberg County. They then call upon union men to stand rigorously for law and order, promptly ejecting any member of the body who violates peaceful relations with his neighbors.

Hyden—In order to clear the title to his own land, a part of which was covered by the old John S. Susade patent to 40,000 acres, and which covered a large portion of the most valuable coal land in Leslie County, F. M. Sackett, of Louisville, recently purchased the patent. Previously Mr. Sackett, in a signed statement, agreed that if the others interested would make no effort to force up the price of the sale, he would immediately issue to each man who owned land covered by this patent a quit-claim deed to this property. His proposition was accepted by the other landowners and at the official sale he obtained the patent rights at $300, thereafter carrying out the agreement as to other land than his own. The sale was under the forfeiture statutes, which provide that when taxes are not paid on land for five years, the title is forfeited, the land sold and the proceeds turned into the state treasury.

McRoberts—It is anticipated that the Lexington & Eastern R.R. will shortly add two extra trains in order to carry the coal now going out from the fields around McRoberts, Fleming and Haymond.

OHIO

Bellaire—It is estimated that already 10,000 men have returned to work in the eastern Ohio coal mines and that 5000 more will go to work shortly. Over 40 mines were affected by the decision recently reached at a conference in Cleveland, whereby the operators decided to pay the 47 cents per ton demanded by the miners. During the long strike just past, many owners of coal mines lost the bulk of their business, but are now again building it up.

Columbus—The Ohio General Assembly has passed a bill which has been signed by the governor to provide for the conservation of oil, gas, coal and other minerals upon school and ministerial lands in Ohio. The law provides that whenever the state sells lands other than canal property it reserves the right to all minerals on such lands.

Since general resumption of mining in the eastern Ohio district there have been a few labor troubles, but these have been generally of small consequence. One of the most noteworthy was the trouble at the West Wheeling mine where the question of the stockholders of the operating company joining the miners' organization was involved. This question has been coming up regularly in that mine which is a sort of coöperative organization. Some trouble has occurred at the Warwick mine in the Coshocton district but it was of short duration. J. M. Roan, Ohio mine inspector, has not yet been called upon to settle a difficulty.

Amsterdam—The Zerbe mine of the Ohio & Pittsburgh Coal Co. was shut down for an indefinite period recently. This action was taken by the mine management after failing to agree with the miners as to the method of checking average mine cars. It has been customary at this property in the past to supply the cager with "average checks," one of which is placed on each mine car that shows evidence of loss of contents in transit. The miners demanded that all persons having to do with the handling of mine cars, such as drivers, motormen, etc., be supplied with "average checks." Superintendent John Lees suggested that the same system as used heretofore remain in force until such time as higher officials of both company and union could make a satisfactory arrangement. This proposition was rejected by the miners and Superintendent Lees stated that operation would be discontinued indefinitely.

ILLINOIS

Belleville—L. D. Turner, attorney for the Belleville Savings Bank and other plaintiffs against the Southern Coal & Coke Co., has announced that an appeal will be taken to the Supreme Court in the case involving the rights of minority bondholders which was decided recently by the Illinois Appellate Court in favor of the Southern company. The question at issue is whether the majority bondholders, in agreeing to an exchange of their holdings for a new issue and afterward exchanging their new bonds for stock in the reorganized company, forfeited their rights in the first mortgage bonds. The contention of the plaintiffs is that they did. The decision of the Appellate Court was that they did not.

Carlinville—Carlinville has a new coal company or rather a reorganized old one. When the mine closed down last spring, it was anticipated that it would never be reopened, but reorganization with many new stock holders has been effected, and the mine will be reopened as soon as necessary repairs can be made. The new firm expects to put in some new equipment and a new gasoline or electric haulage system for work underground. Some apparatus for coal preparation will also be installed.

Gillespie—The Superior coal mines at Gillespie recently set a new record for mining coal. Mine No. 3 in one day hoisted 5195 tons or 1546 mine cars.

FOREIGN NEWS

Cardiff, Wales—Five thousand Welsh coal miners struck June 14 because of the introduction of the open shop system.

Fernie, B. C.—On the 8th inst. 1100 miners employed at the Coal Creek mines of the Crows Nest Pass Coal Co. went out on strike. The men of British, Russian, Belgian and Italian nationality demanded the dismissal of a number of Germans and Austrians in the employ of the company, which was refused. The military authorities have taken action and on the 9th about 100 unnaturalized Germans and Austrians were interned. This step will probably result in a speedy settlement of the trouble.

PERSONALS

J. C. Brooks, of Louisville, has been appointed commissary manager for the Luke & Drummond Coal Co., succeeding Joe Bruce.

George Watkin Evans, consulting mining engineer, of Seattle, Wash., recently returned from a professional visit to New York City.

D. D. Davidson, formerly of Columbus, Ohio, but who has been located at Grand Rapids, Mich., for the past year, from which city he covered Michigan territory for the New York Coal Co. has gone with the Gate-Churchill Co. of Detroit.

H. M. Byars, superintendent of the Tennessee Coal & Iron Co.'s coal mines at Johns in the Blue Creek region, has just been appointed a member of the Jefferson County Board of Education, to succeed Prof. I. W. McAdory who resigned on account of his health.

Joseph Battles has been appointed district sales manager for the Terry Steam Turbine Co. at Denver, covering the states of New Mexico, Colorado, Wyoming and the western portion of Nebraska. Mr. Battles' address is 326 First National Bank Bldg., Denver, Colo.

W. J. Richards, president and general manager of the Philadelphia & Reading Coal & Iron Co., delivered an address on "Anthracite Mining and Selling" before the convention of the Pennsylvania Retail Coal Merchants' Association in session at Wilmington, Del., on the 16th instant.

J. B. McKenna was recently appointed general manager of the Colorado Fuel & Iron Co., an office which has not been in existence since 1901. Mr. McKenna has been in the employment of the company for 21 years, the last nine of which were spent as manager of the steel works at Pueblo, Colo.

E. C. Roberts, Jr., superintendent of the mines of the Fairmont Coal Co., under management of the firm of E. L. Hedstrom, has resigned and enlisted in a Canadian regiment in Toronto. He has been a member of the 74th Regiment, New York National Guard, and will go out as a second lieutenant.

Patrick Threston, of Plymouth, Penn., while going to work at the Gaylord colliery recently trod upon earth which had been undermined. This resulted in a cave, the earth, settling down around Threston, who narrowly escaped suffocation. His cries brought workmen who hauled him out of the cave by means of a rope.

John Paul, outside foreman at the Pine Knot colliery of the Philadelphia & Reading Coal & Iron Co., has been promoted to superintendent of the collieries in the Minersville District. Elmer Artz, outside foreman at Otto colliery, was transferred to Pine Knot, and John Withelder, assistant foreman at Otto, has been advanced to foreman.

James L. Richards is understood to have resigned from the board of the New England Coal & Coke Co., of which he has been president. Joseph B. Russel, who has also been a director in both the New York, New Haven & Hartford R.R., and the New England Coal & Coke Co., has resigned from the latter. These resignations follow somewhat drastic legislation in Massachusetts prohibiting interlocking directorates.

An attempt was recently made to assassinate J. L. Schull, general manager of the E. C. Snarles mine at Johnson City, Ill. Shots fired at him through the window of the library at the home of his father-in-law, W. E. Chapman, missed him, but struck Chapman and Mrs. Schull. Chapman was killed. Mrs. Schull will recover. The attempt on the life of Schull, it is believed, was on account of the discharge by him of several Sicilian miners.

OBITUARY

Joseph Saronera, mine stripping contractor, aged 65 years, died of heart failure on June 8. He was one of the largest contractors in Shenandoah (Penn.), having 200 men employed by him. He also held a prominent place in the affairs of the community.

H. L. Bevan, superintendent of the Carney Cherokee Coal Co., was drowned June 11 in attempting to swim in the water which filled a strip pit near Mulberry, Kan. Mr. Bevan was seized with cramps and drowned before he could be rescued. He had volunteered to swim to the shovel in the center of the pit, as it had become necessary to reach the machine and no boat was available.

John W. Reid, superintendent of the Old Forge District for the Pennsylvania Coal Co., died recently at Dr. Burns' hospital in Scranton. Mr. Reid was born in England, but came to this country when a boy. He was connected with the Pennsylvania Coal Co. for 46 years, in 1912 being made superintendent of the Old Forge District, embracing Old Forge, Central, Consolidated, and Sibley mines. He is survived by his wife, one son, and one daughter; also a sister.

Angus M. Cannon, 81 years of age, Director of the Savings Bank & Trust Co., and widely interested in business and mining ventures throughout Utah, died recently at his residence at Ashton Ave. and Lake St., Forest Dale. Death was due to general debility due to age. Mr. Cannon, who was a patriarch in the Mormon Church, was born in Liverpool, England, in 1834, coming to this country in 1842. Mr. Cannon was among the pioneers who came to Salt Lake Valley in 1849. He later opened extensive coal deposits along Grouse Creek near Coalville in Summit County, and engaged actively in the coal business. He was also highly instrumental in mineral and land developments throughout the entire state.

Patriarch Cannon is survived by three widows, Mesdames Clara C., Martha M. P. H., and Maria B. Cannon, also by 113 children, grandchildren, and great grandchildren.

RECENT COAL AND COKE PATENTS

Grate Bar. T. S. Johnson, Scranton, Penn. 1,125,551 Jan. 12, 1915. Filed Apr. 7, 1913. Serial No. 759,560.

Furnace Grate. T. M. Kekich, Chicago, Ill. 1,131,524 Mar. 9, 1915. Filed June 28, 1913. Serial No. 776,391.

Gas Producer. H. L. Wallman, Chicago, Ill. 1,125,919 Jan. 12, 1915. Filed July 20, 1908. Serial No. 444,517.

Mining Machine. L. Robinson, Empire, Ala. 1,124,528 Jan. 12, 1915. Filed July 7, 1913. Serial No. 777,762.

Mining Implement. A. Kolenic, Streator, Ill., 1,137,637, Apr. 27, 1915. Filed Jan. 14, 1914. Serial No. 812,111.

Furnace Grate. W. M. Duncan, Alton, Ill. 1,132,918 Mar. 23, 1915. Filed Feb. 21, 1913. Serial No. 749,804.

Smoke Preventer. W. C. Beam, Rockford, Ill. 1,131,106 Mar. 9, 1915. Filed June 14, 1913. Serial No. 773,709.

Mechanical Stoker. A. G. Elvin, Somerville, N. J., 1,137,471, Apr. 27, 1915. Filed Sept. 19, 1914. Serial No. 862,434.

Miner's Lamp. O. V. Fortney, Kitzmiller, Md. 1,132,324 Mar. 16, 1915. Filed Sept. 11, 1914. Serial No. 861,287.

Safety Device for Mine Cars. F. Davis, Uniontown, Penn. 1,132,914 Mar. 23, 1915. Filed Mar. 28, 1914. Serial No. 827,865.

Smoke Consuming Furnace. E. Stanley, Watertown, S. D., 1,136,287, Apr. 20, 1915. Filed Dec. 5, 1908. Serial No. 466,186.

Mine Drill Support. H. P. Corsa, Bingham Canyon, Utah. 1,125,480 Jan. 12, 1915. Filed Nov. 18, 1913. Serial No. 801,679.

Automatic Stoker. D. F. Crawford, Pittsburgh, Penn. 1,131,214 Mar. 9, 1915. Filed June 27, 1910. Serial No. 569,161.

Fuel Saver and Smoke Consumer. J. L. Webster, Ottawa, Canada. 1,125,228 Jan. 12, 1915. Filed Jan. 17, 1914. Serial No. 812,735.

Fire Bridge for Boiler. G. H. Butterworth and R. Canlin, Liverpool, Eng., 1,137,048, Apr. 27, 1915. Filed May 4, 1912. Serial No. 695,258.

Dump Car. C. H. Clark, assignor to Clark Car Co., Pittsburgh, Penn., 1,136,310, Apr. 20, 1915. Filed July 15, 1908. Serial No. 443,654.

Screening Chute for Coal Pockets. C. G. Pfeiffer, Philadelphia, Penn. 1,125,709 Jan. 19, 1915. Filed July 29, 1913. Serial No. 781,709.

Boiler Furnace. J. Dick, assignor to Phœnix Iron Works, Meadville, Penn., 1,137,465, Apr. 27, 1915. Filed Jan. 27, 1913. Serial No. 744,357.

Mechanical Stoker. C. F. Street assignor to Locomotive Stoker Co., Wilmerding, Penn. 1,130,443 Mar. 2, 1915. Filed Mar. 2, 1908. Serial No. 418,837.

Mining Machine and Truck. N. D. Levin, assignor to Jeffrey Mfg. Co.. Columbus, Ohio, 1,137,337, Apr. 27, 1915. Filed Aug. 31, 1910. Serial No. 579,798.

Machine for Mining Coal. C. H. Boardman assignor to Sundries Mfg. Co., Portland, Maine. 1,130,250 Mar. 2, 1915. Filed Mar. 24, 1914. Serial No. 826,963.

Mining Machine Truck. C. J. E. Waxborn, assignor to Jeffrey Manufacturing Co., Columbus, Ohio, 1,136,301, Apr. 20, 1915. Filed July 13, 1911. Serial No. 638,410.

Feeding and Stoking Attachment for Furnaces. J. A. Lanigan, Lancaster, Penn., and D. J. Carson, Buffalo, N. Y. 1,130,411 Mar. 2, 1915. Filed Oct. 14, 1912. Serial No. 725,602.

Mechanical Stoker. H. Iserman, assignor to Multiple Grate Bar Endless Chain Stoker Co., a corporation of New York. 1,125,544. Jan. 12, 1915. Filed Sept. 11, 1911. Serial No. 648,745.

Grate for Mechanical Stoker. F. M. Clark, assignor to Multiple Grate Bar Endless Chain Stoker Co., a corporation of New York. 1,125,474. Jan. 12, 1915. Filed Sept. 11, 1911. Serial No. 648,802.

INDUSTRIAL NEWS

Reform, Miss.—Coal mines will soon be opened here. Coal mining is a new industry for Mississippi.

Montgomery, W. Va.—The Long Branch Coal Co. is building a half mile of railroad and making changes in its tipple. The new track will bring the cars nearer the mine.

Birmingham, Ala.—The Pratt Consolidated Coal Co. is running a steamer, the "M. Carney," for the transfer of passengers and freight from Cordova to Mobile, on the Warrior River.

Boston, Mass.—On and after June 15 the Boston office of the Sullivan Machinery Co. will be situated at 185 Devonshire St., Room 1010, Unity Bldg., instead of at 35 Federal St., as in the past.

Huntington, W. Va.—The coal shipments on the Ohio River during the first week in June were the largest in 50 years, as over 8,000,000 bushels of coal were shipped from Pittsburgh to Cincinnati.

Buffalo, N. Y.—The steamer "E. D. Carter," of 10,000 tons capacity, has been bought by Boland & Cornelius and others and renamed the "W. T. Roberts," after the sales agent of Williams & Peters.

Birmingham, Ala.—The Atlantic Coast Line has just awarded contracts aggregating 260,000 tons of coal to the Pratt Consolidated Coal Co., the Galloway Coal Co., the Eldorado Coal Co. and the Alabama Fuel & Iron Co.

Baltimore, Md.—The Baltimore & Ohio R.R. during the month of May handled 250,000 tons of coal for export. Part of these shipments went to South America, and a part to Italy, France, Sweden, and other countries.

Brownsville, Penn.—Almost twice the amount of coal passed through the Brownsville lock during the month of May as in April. During the month 641,900 bu. of coal were shipped through the lock to points west against 384,000 bu. locked through in April.

Jenkins, Ky.—An order for 200,000 tons of coal to be sent to Tidewater as soon as possible, was recently concluded between the Italian Government and the Consolidation Coal Co., according to information which is believed to be authentic. It is not known definitely what route this coal will be shipped over or what its port of destination on the Atlantic Seaboard will be.

Sugar Notch, Penn.—Philip Mulholland recently brought suit against the Delaware, Lackawanna & Western R.R. Co., asking $10,000 damages for injuries received when struck by a piece of coal which fell down the shaft of the Truesdale Colliery where he was employed as a foot tender. He charges negligence on the part of the company in failure to provide a safe place in which to work.

Knoxville, Tenn.—An involuntary petition in bankruptcy has been filed in the Federal Court here against the Petros Coal Mining Co. The company, according to the petition, went into a receiver's hands on the first of June when the House-Hanson Hardware Co. filed suit against it in the Morgan Circuit Court. The Petros company is a Georgia corporation with property in Morgan County.

Montgomery, W. Va.—Coal tonnage over the Chesapeake & Ohio R.R. for the month of May surpassed all previous records for that month. The figures show that there were handled 2,044,175 tons of coal which is an increase of 233,175 tons over May of last year. During April 1,808,000 tons were hauled. The prospects for June are good, and it is believed that this month will be another record breaker.

Baltimore, Md.—During May the Consolidation Coal Co. made a record in the output of coal from its mines. During the month it produced 1,158,562 net tons, which is nearly 70,000 tons above the previous record, which was made in June, 1914, when the output was 1,089,200 net tons. The present daily output is about 50,000 tons and it is anticipated that this will be kept up throughout the entire current month.

Columbus, Ohio—One of the features of the annual meeting of the Michigan-Ohio-Indiana Coal Association which will be held at Cedar Point, June 22 and 24 inclusive, will be the display of mining machinery, methods of accounting and products of the mines of the operators in the three states. This feature is attracting considerable attention as it is the first time that such a display has been held in conjunction with the convention.

Philadelphia, Penn.—Shipments of anthracite coal in May decreased from the total in the same month last year by 483,592 tons. For the five months ending May 31, the shipments were 26,279,202 tons against 26,815,603 tons in the corresponding period of last year, making a decrease of 536,401 tons. Shipments for May amounted to 5,797,961 tons, the Lehigh Valley handling the greatest tonnage, its shipments amounting to 1,273,106 tons.

Memphis, Tenn.—Five boats and one barge of coal, valued at about $45,000, were recently sunk in the river when the "John A. Wood," tow boat of the Pittsburgh Coal Co., with a tow of coal boats bound south, rammed a steam shovel of the West Kentucky Coal Co. Five boat loads of coal went to the bottom, while the remaining ten floated away. The "Wood" succeeded in gathering up these derelicts and proceeded down the river to consolidate the fleet. One barge of the West Kentucky Coal Co. was also sunk.

New York, N. Y.—The S. K. F. Ball Bearing Co. has been obliged to greatly increase its office space in the Hudson Terminal Building. Within the last four months it has about doubled its offices so that it now occupies a full wing on the sixth floor of the Hudson Terminal Bldg., 50 Church St., New York. This firm is the only ball bearing company importing bearings from Europe that has not been interfered with by the war. Sweden, being a neutral country, is enabled to send large and regular shipments via Norway and Denmark without entering the war zone.

Morgantown, W. Va.—The mining industry of West Virginia was recently enriched by two fine collections of safety lamps and one of rock specimens given, sold, and loaned to the West Virginia State University. James T. Beard, of New York, and William Clifford, of Jeannette, Penn., furnished the safety lamps, while Stuart M. Buck, of Bramwell, W. Va., furnished the rock specimens which were gathered in the Hartz Mountains, Upper Silesia, Northern Hungary, Transylvania, India, the Bohemian border and the Rhine District. This collection also contains specimens from Vesuvius gathered as early as 1835.

Richwood, W. Va.—The suit of the Cherry River & Southern R.R. Co. against the Gauley Coal Land Co. resulted in a decision in favor of the railroad company. The suit grew out of an attempt on the part of the railroad to secure a right of way down Gauley River from Curtin via Brook Ferry and Meadow River to Anglins Creek in Greenbrier County. The company based its objection on the ground that this road would be of a private nature and of little benefit to the public at large. Condemnation proceedings against the land company will be at once instituted, and as soon as these are settled work will be commenced and pushed to completion.

Cincinnati, Ohio—John S. Jones, of Chicago and Granville, Ohio, filed another motion in the U. S. District Court, June 12, in his litigation over the purchase of the stock of the Sunday Creek Co. from the Hocking Valley and allied railroads. The latest motion avers that he has not secured complete control of the affairs of the Sunday Creek Co. for the reason that the Bankers' Trust Co. of New York is still holding certain beneficial certificates, representing the capital stock of the Continental and Hocking companies, subsidiaries of the Sunday Creek Co. He claims that the Bankers' Trust Co. holds the stock for two purposes. One is to secure a performance of the contract between the coal company and the railroad companies for an equal division of the freight from the mines. The other is to secure a guaranty of the railway companies of the bonds of the coal companies. He charges that the Bankers' Trust Co. gave proxies to Gustav Von Der Steinen, who voted the stock at the annual election.

Cincinnati, Ohio—The transaction involving the sale of the properties of the Marmet Coal Co., which has been pending for some months, was consummated recently. The deal is part of negotiations recently concluded, involving the largest sale of coal properties that has ever been made in West Virginia. The purchase price for all the properties involved is said to be between $19,000,000 and $20,000,000, the Marmet properties bringing $1,500,000.

The identity of the interests purchasing the properties was not disclosed, but they are said to include some of the strongest banking interests in New York and Philadelphia. A corporation to be known as the Kanawha Splint Coal Co. has been chartered in West Virginia to take over and operate the properties as one giant coal concern.

Negotiations still pending for other properties may bring into a merger with them $10,000,000 worth of additional holdings in which event it is said the entire project will be taken over by interests in Chicago, New York, Toledo and Columbus identified with the Kanawha & Michigan and the Toledo & Ohio Central railroads. This latter deal has been agreed to by the purchasers of the present involved properties, it is said, provided the additional holdings are obtained, whereupon the entire project will be turned over to the railroad interests.

Coal Trade Reviews

General Review

Concessions on the anthracite circular are readily obtainable in spite of the heavy curtailment. Bituminous exports taxing the loading facilities at Seaboard. Prices a trifle firmer on spot business. Poor showing in the Lake trade.

There is only the thinnest pretense of holding to the anthracite circular and this is only being accomplished by the most rigid curtailment in all directions. June is maintaining its reputation as the dullest month of the year, and the situation is so discouraging that a number of far-sighted buyers have been successful in forcing particularly advantageous terms covering their requirements until the first of the year. But as a rule complaints are not so general among the hard-coal companies as in bituminous; experience has shown that any deficiency in the summer buying is invariably made up in the fall, and the companies as a rule are content to wait their time. In the meantime vigorous action is necessary to keep stocks down and save demurrage charges, particularly on the steam sizes.

With the export bituminous business increased to a point where the loading facilities at Seaboard are being taxed to their full rated capacity, prices are firmer, although actual sales still continue on the same basis. A very slight increase in the spot demand, occasioned probably by some of the more timid consumers anticipating a reaction in the market, has eliminated concessions generally, but competition continues so keen for what business appears, that there is still little hope of any immediate relief.

Prices in the Pittsburgh district are as uncertain as ever, and there appears to be more free coal being offered. Lake shipments make a poor showing even as compared with the exceedingly light movement of last year, and heavy shipments from now on could scarcely bring the tonnage up to last year, while some shippers are receiving requests to restrict shipments still further on account of the congestion at the upper Lake docks.

Optimism prevails in the Ohio market market, due apparently to the appearance of some demand for stocking purposes and a very small increase in the Lake movement. The domestic market occupies a strong position technically due to the light supplies on hand, and the heavy restriction in the consumption of the steam grades. On the other hand steam consumers are still confining their purchases generally to the open market while contracting is attended with great difficulty.

The Middle Western agencies are still experiencing a general dullness, but an advance in quotations is under consideration for the first of next month when the storage coal starts moving. With the exception of an occasional manufacturer working on war orders, the general railroad and industrial demand continues at a minimum. Even the screenings situation has become notably easier during the past week. The anthracite market is somewhat steadier, but the shortage of Eastern coal is becoming more pronounced.

A Year Ago—Further curtailment in the anthracite regions and demand easing off all along the line. Bituminous consumers crowding operators for better prices and markets weak with more declines in sight. Lake trade fair in some sections. Uncertainty in the Ohio situation rapidly clearing up.

BUSINESS OPINIONS

Boston News Bureau—Probably one of the most serious features in the situation is the demoralization in the sterling exchange market. American securities held abroad do not come out in sufficient volume to stem the tide, and our sales of munitions of war to the allies keep steadily increasing European indebtedness. Business in war orders is at the maximum and domestic trade is slowly improving. General confidence is buoyed up by our splendid crop prospects, by our enormous exports of products and by easy money and gold imports.

Dry Goods Economist—Many manufacturing concerns are well pleased with the extent to which their production is taken care of by large orders from foreign governments.

Iron Age—Betterment both in sentiment and in orders is reflected in the week's developments in the steel market. Rail and car orders continue to come from Russia and France. In the past week France has placed 3745 cars in the United States and Canada, including 2000 10-ton box cars and 1000 20-ton flat cars. Its rail orders to the Steel Corporation may have totaled 50,000 tons in the past three months, but there has been no recent order for that amount, as just reported. Of Russia's rail orders 13,000 tons went to Chicago for rolling in the past week and 4000 tons to Pittsburgh. Russia's standard car order was for 13,000, and 75,000 tons of steel have just been placed at Pittsburgh for 7000 of these. As a climax, there are the Russian contracts for 400 locomotives, of which at least 350 come to this country.

Dun's—While general business gains but slowly, the economic situation grows steadily stronger. International uncertainties are still a restraining influence, yet constructive forces multiply and the absence of speculative excesses is helpful of sustained progress.

Marshall Field & Co.—Weather conditions have so retarded retail distribution of dry goods that the semiannual preinventory sale the first three days of this week did not bring as many merchants to market as the corresponding week last year. Road sales and mail orders, however, brought the wholesale distribution of dry goods for the current week up to normal.

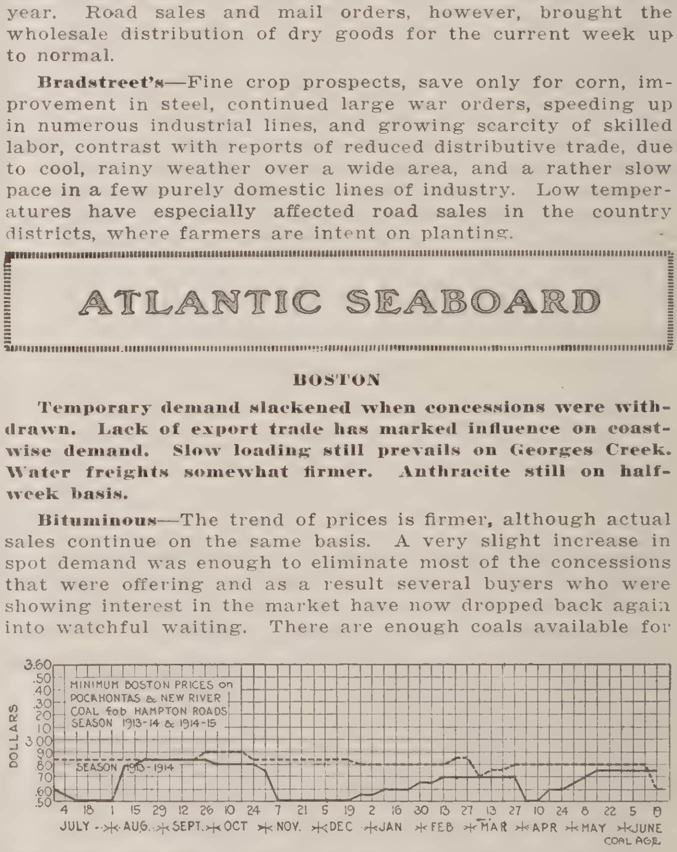
Bradstreet's—Fine crop prospects, save only for corn, improvement in steel, continued large war orders, speeding up in numerous industrial lines, and growing scarcity of skilled labor, contrast with reports of reduced distributive trade, due to cool, rainy weather over a wide area, and a rather slow pace in a few purely domestic lines of industry. Low temperatures have especially affected road sales in the country districts, where farmers are intent on planting.

ATLANTIC SEABOARD

BOSTON

Temporary demand slackened when concessions were withdrawn. Lack of export trade has marked influence on coastwise demand. Slow loading still prevails on Georges Creek. Water freights somewhat firmer. Anthracite still on half-week basis.

Bituminous—The trend of prices is firmer, although actual sales continue on the same basis. A very slight increase in spot demand was enough to eliminate most of the concessions that were offering and as a result several buyers who were showing interest in the market have now dropped back again into watchful waiting. There are enough coals available for this territory besides those shipped from Hampton Roads to make buyers sure of getting supplies at moderate prices, for the present at least, and while Pocahontas and New River have the preference ordinarily, the parties who have yet to contract will not give them much, if any premium.



Low prices continue to be made at the distributing points for delivery inland, and these not so much because of forced sales from "market cargoes" but from rehandling plants in order to keep stocks moving.

There is still talk of possible shortage the coming winter but with perhaps less confidence on the part of the agencies. Certainly there is enough competition over the few orders that come into the market from time to time, and buyers are not as much impressed as they were. The state of the export trade continues to have much to do with the attitude of shippers. Just now it has rather sagged.

There is only a hand-to-mouth supply of Georges Creek for coastwise requirements. Detention again prevails at the Baltimore piers, causing fewer trips of barges and steamers to this territory and therefore a much reduced tonnage.

Firmer prices on the West Virginia coals have the effect of renewing the buyers' interest in the high grades from Pennsylvania. All these brands are actively represented in New England and unless present signs fail their tonnage here is bound to increase. In many quarters where five years ago nothing but Georges Creek was considered, several low-volatile, low-sulphur coals from Pennsylvania are now favorably received, even on the small requirements for forge use.

Water Freights have shown a little advance under the stimulus of better inquiry for coal a week ago and the slow movement of tonnage on account of weather; 90c. was asked for 1500@2000 tons, Hampton Roads to Boston, but nothing higher than 85c. has so far been reported. This is an advance of 5@10c. over the rates reported a fortnight ago.

Anthracite—Mining continues on the basis of three days a week at most of the company mines and there is therefore not a great quantity of domestic sizes offering for sale. On the other hand there is a little complaint that the larger shippers are not filling orders as fast as they might. There is no shortage of any kind or size; it is simply that the operating interests are narrowing the output to the current needs of the market.

Prices on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.75@2.85
Boston†	....	....	....	3.60@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

NEW YORK

Heavy exports continue the mainstay of the bituminous market. Little cheap coal being offered. Customary June lethargy prevails in anthracite and mine operations are heavily curtailed.

Bituminous—The export situation continues to be the one redeeming feature of the soft-coal market, new inquiries being received almost daily. The general situation at the New York harbor has changed but little and prices remain practically the same. Shippers are not over-stocked but are able to make prompt shipments on all orders.

The local docks are well supplied with coal, mostly of medium grades, some of which have been offered to quick buyers at substantial concessions. Operations at the mines have not improved; some of the mines producing the high-grade coals are working on an average of five days a week while others are scarcely making half-time. Large manufacturers in New England whose stocks are being gradually depleted are making inquiries regarding prices and quick shipments but do not seem anxious to close contracts. Many large users continue to take shipments in excess of their quota. Demurrage coal is not much in evidence but occasionally a buyer has an opportunity to pick up a real bargain. Some western Maryland was quoted on Monday at $2.15. Average prices of various grades of soft coal during the past week were as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85
Georges Creek Tyson	3.00@3.10	3.00@3.10	3.00@3.10	1.45@1.55
Clearfield:				
Medium	2.65@2.80	2.55@2.65	....	1.10@1.25
Ordinary	2.55@2.60	2.55@2.60	....	1.00@1.10
Broad Top Mountain				1.10@1.45
Cambria County:				
South Forks	2.90@3.05	....	....	1.35@1.50
Nanty Glo	2.75@2.80	....	....	1.20@1.25
Barnesboro	2.65@2.70	....	....	1.10@1.15
Somerset County:				
Quemahoning	....	2.70@2.85	2.70@2.85	1.20@1.30
Medium	2.65@2.70	2.60@2.65	2.60@2.65	1.10@1.15
Latrobe	2.45@2.55	....	....	0.90@1.00
Greensburg	2.75@2.80	....	....	1.10@1.15
Westmoreland	2.95@3.20	....	....	1.15@1.40
West Virginia Fairmont ¾		2.60@2.70	2.60@2.70	0.80@0.90
Fairmont mine-run		2.50@2.60	2.50@2.60	0.70@0.80
Steam		2.45@2.50	2.45@2.50	0.90@0.95
Western Maryland		2.35@2.45	2.35@2.45	0.80@0.90

Anthracite—The month of June promises to maintain its reputation as the dullest month in the year on anthracite coal. Salesmen report a scarcity of orders and only heavy curtailing of operations is keeping the market from being over-stocked. Many of the mines continue to work on a three-day-a-week basis and the prospects for improvement are not bright. Some shippers are urging consumers to fill their bins in anticipation of a shortage of labor in the mining regions before long.

While shipments at tidewater are prompt, inland dealers are complaining of slow deliveries. Demand for chestnut is slow and considerable of this size is being stored. The call from Canada and the Northwest is brisk and proves to be a good outlet.

The supply of steam sizes is becoming excessive and strong efforts are necessary to keep down the stocks and to save demurrage charges. As a result much good coal is sold at low prices.

Current quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken	$4.75		$4.80	
Egg	5.00	$4.80	5.05	$4.85
Stove	5.00	4.80	5.05	4.85
Chestnut	5.25	5.00	5.30	5.05
Pea	3.35@3.50	3.10@3.35	3.40@3.55	3.15@3.40
Buckwheat	2.50@2.75	2.25@2.50	2.55@2.80	2.30@2.55
Rice	2.00@2.25	1.90@2.10	2.05@2.30	1.95@2.25
Barley	1.75@2.00	1.60@1.75	1.80@2.05	1.85@2.10

PHILADELPHIA

Anthracite trade showing more than the usual summer dullness. Low prices for all sizes, particularly pea, and few buyers. School-coal prices create a stir. Bituminous trade quite dull, but with some prospects for betterment.

Anthracite—The past week has been extremely quiet. Orders are scarce and buying is strictly limited to the current demand. Offerings are reported on all sizes at a considerable reduction on the circular, with the exception of stove, which is held close to the circular, several companies reporting their inability to meet all orders for this size. This is due to restricted mining and not to any unusual demand, as the companies claim they cannot operate their collieries for one size alone.

Pea, as usual, seems to be the particular sufferer, as low as $1.50 being noted on this size, although $1.75 seems to be the market price at the present moment, and some operators still deny they are even selling as low as $2; but despite this assertion the fact still remains that many of the retail men openly state they are protected on the $2 rate up to Jan. 1, 1916. It is noted that there was a bona fide offer made this week on 400 to 500 tons of this size at $1.85, shipper prepaying the freight and giving the customer 90 days to pay the bill. Yet with all these inducements the offer was declined. It appears as though some of the mining interests have come to the conclusion that it is better in the long run to move pea coal at a fair price than to store it indefinitely for future delivery.

Bituminous—The trade still complains of a lack of activity, although operators are optimistic for the future. Tidewater shipments are likely to increase within the next few months to such a volume that it will bring the price to a point higher than for several years, although a drawback to the situation will be the lack of bottoms to move the tonnage.

The circular and individual prices for the week are as follows:

	Line and City	Tide	Individual Line and City
Broken	$3.20	$4.45	$3.00
Egg	3.45	4.70	3.30
Stove	3.70	4.70	3.65
Chestnut	3.85	4.95	3.75

BALTIMORE

Export trade continues to grow and last week saw a new high record for a seven-day movement. Domestic situation very flat.

With a rush that keeps the piers here working almost at full capacity the export trade from this port continues to expand. Last week saw a record movement for a seven-day period; a total of 70,360 tons was sent out as cargo fuel to foreign ports, the same carriers taking 10,849 tons of bunker coal. If maintained this would mean a monthly movement of between 250,000 and 300,000 tons, for June.

The domestic situation remains flat. Coal is selling at almost anything offered, at least on the poorer grades. Slack is not so strong and is offering at 40 to 45c. Cheap coals in both Maryland and West Virginia may be had at 75 to 80c. Low grade Pennsylvania coals are holding around 90c. as a rule.

During the past week the following charters were announced for foreign loading at this port:

Vessel	Country	Tonnage	Destination
Antonio	British	1663	Montevideo
Atlantic	American	3248	Buenos Aires
Hercules	Spanish	2499	Italy
Gleneden	British	3018	Naples
Phoebus	Italian	2013	Italy
Apollo	British	2442	Marseilles
Bratland	Norwegian	3000	Denmark
Ontenada	Spanish	2232	Buenos Aires
Claveresk	British	2441	Felton, Cuba
Castlemoor	British	....	Egypt
Arundo	Dutch	1998	Brazil
Andros	Greek	1859	Siciliy
William E. Downs	American	639	Porto Rico

All the above are steamers except the "William E. Downs," which is a schooner.

HAMPTON ROADS

Export loadings still holding up well. Prices remain at circular. Tonnage at Tidewater slightly above normal.

The dumpings over the various piers at Hampton Roads for the week have been heavy, especially as regards export shipments. Large cargoes have also been moving to New England and ports South. The bunker movement for the week has been fair; while the number of steamers calling for bunker coal have not been so numerous the quantity loaded has been large, some of the vessels taking as high as 1600 tons and over.

The accumulation of coal held by some of the shippers is rather heavy but other suppliers are in some cases short and having coal hurried forward from the mines; on a whole, however, the supply is perhaps in excess of normal.

Schooners are still engaged in the export movement and are loading for ports as far away as Casa Blanca, Morocco, the schooner "Woodward Abrahams" having taken 963 tons for that port. One of the most interesting vessels supplied with bunker coal was the Dutch cruiser "Jacob Van Heemskerck" which took on board 767 tons from barges. Of the export cargoes from Hampton Roads the heaviest shipment was taken by the collier "Ulysses" which loaded over 12,000 tons for the Canal Zone.

OCEAN CHARTERS

Coal charters have been reported by the "Journal of Commerce" as follows:

Vessel	Nationality	From	To	Tons	Rate
Verdun	British	Virginia	Rio Janeiro	2950	$8.76
	Foreign	Virginia	Rio Janeiro	6000	8.64
Edith H. Symington		Philadelphia	Seville	881	7.25
Masarua	British	Baltimore[1]	Rio Janeiro	3189	8.76
Jata Mendi	Spanish	Philadelphia	Barcelona	2746	9.60
North Pacific	British	Baltimore[1]	Italy[2]	2493	10.80
Catalone	British	Baltimore[1]	Italy[2]	2410	
Christoforos	Greek	Baltimore[1]	Italy[2]	2410	
Itasca		New York	Mobile	989	2.00
Achlibster	British	Baltimore	Algiers	2820	10.80
Castlemoor	British	Baltimore	Alexandria	2404	
Andros	Greek	Baltimore	Palermo	1859	
James B. Drake		Norfolk	Lisbon	991	

Note—Steamers are indicated by **bold face type**, all others being schooners.

[1] Or Virginia. [2] West Coast.

OCEAN FREIGHTS

Rates to the West Coast of Italy have declined and steamers can now be secured at or about $10.04. The steamer "Jata Mendi," about 6000 tons' cargo capacity, was chartered to load at Philadelphia for Barcelona at $9.60, and steamers are offered for similar business at $9.36, and will no doubt accept $9.24, possibly $9.12. A large steamer is reported as having been chartered to load coal at Virginia for the Lower Plate at $8.40, but this seems considerably above the market.

Rates are now quotable on about the following basis:

To	Rate
Havana	$2.00@2.25
Cardenas or Sagua	3.00
Cienfuegos	2.75@3.00
Port au Spain, Trinidad	3.50@4.00
St. Lucia	3.50@3.75
St. Thomas	3.00@3.50
Barbados	3.50@4.00
Kingston	2.75@3.00
Curacao	3.50@3.75
Santiago	2.50@3.00
Guantanamo	2.50@3.00
Demerara	5.00@5.25
Bermuda	$3.50@3.75
Vera Cruz	3.50@3.75
Tampico	3.50@3.75
Rio	8.64
Santos*	8.88
Montevideo	7.44@7.92
Buenos Aires or La Plata	7.68@8.16
Rosario	8.40@8.64
West Coast of Italy	9.80@10.08
Spain**	**9.24**
Valparaiso or Callao	6.75@7.00
Marseilles	**9.24**

Note—Rates noted in **bold face type** are only approximate.

* Consignees paying dockage dues. **Spanish dues for account.

W. W. Battie & Co.'s Coal Trade Freight Report.

COKE

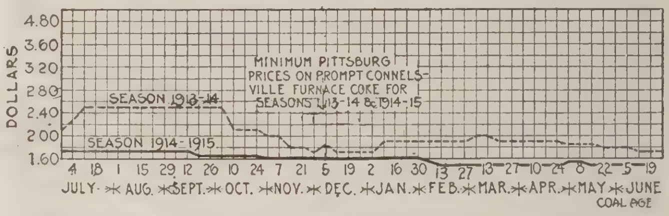
CONNELLSVILLE

Furnace-coke inquiry still in market, with operators stiffening in prices. Foundry demand moderate. Production slightly decreased while shipments make new high record for the year.

No contracts have been closed as yet against the inquiry for second-half furnace coke noted a week ago, and totaling 40,000 tons a month or more. Operators are making an effort to sell on the sliding scale basis, putting the minimum at $1.75, with advances in case basic pig iron advances over $12.50, Valley. It is reported, but not confirmed, that two or three contracts were made a few weeks ago on this basis. Thus far buyers contend that they should not pay over $1.75 at the outside, as a flat price.

The prompt furnace coke market continues stagnant. Foundry coke is in only fair demand for prompt, while there is not much contracting except by those who must have their favorite brands. We quote furnace coke at $1.50 for prompt, $1.60 for June and $1.75 for second-half and foundry coke at $2@2.40 for prompt and $2.20@2.40 for contract, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended June 5 at 314,897 tons and shipments at 321,141 tons, an increase of 5618 tons, this being the best record of the year for shipments.



Buffalo—There is some report of a larger demand for coke, but not of better prices. As a rule the trade is quiet, the general demand for iron and steel not improving. The furnaces in this district are running at a fair rate, but it is agreed that sales are not made easily and that consumers are not willing to stock up. There is no advance in prices, even with considerable scarcity of men reported in the furnace districts. Quotations remain on the basis of $4.15 for best 72-hr. Connellsville foundry, with stock coke at $3.15.

Chicago—A fair demand has been noted for domestic sizes, and increased orders have been placed for furnace and foundry coke. Prices are as follows: Byproduct, $4.55@4.75; Connellsville, $4.60@4.75; Wise County, $4.50@4.65; gas coke, $3.75; furnace, $4.60@4.75.

LAKE MARKETS

PITTSBURGH

No tendency for Lake shipments to increase. Heavy offerings of free coal, with prices as ragged as ever. Operations about 60%.

There has been no further improvement in Lake shipments and, indeed, some operators are in receipt of requests to curtail shipments on contracts on account of crowded docks. Shipments to date make a poor showing as compared with last year, and at this rate a considerable increase could occur after Aug. 1 without making the season's total larger than that of last year. If anything, there is more free coal offered now than formerly, and prices are as much cut up as ever. Manufacturing demand is as good as a week ago, but has shown no further increase. Mines are operating at about 60% of capacity.

The contract asking price on mine-run, to Apr. 1, continues to be about $1.15, but this is practically nominal, as there is no contract demand. We quote the market for prompt unchanged as follows: Slack, 55@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

No stir yet in either anthracite or bituminous. Buyers holding off for lower prices or for fall weather to set in. Tone of market shows a slight improvement.

Bituminous—The Buffalo jobber and shipper is waiting as patiently as possible for some stir. The price of bituminous is not changed, as it is practically at the bottom, where it has been for a long time. Quotations are: $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.45 for slack. Allegheny Valley sizes are about 25c. lower than Pittsburgh, all slack being about on a par. There has been a better demand for slack than for sizes, largely on account of its paying less duty in Canada.

Anthracite—While the monthly report of output looks fairly good there is a very dull situation in anthracite everywhere and prospects for only a slight improvement till after the hot weather is past. The anthracite companies are not complaining as the bituminous shippers are, because they expect that any undue slackness now will be made up before the end of the year. Reports from the mines agree that the anthracite collieries are not running much more than the bituminous so it appears that the storage room in sight is not large. The local trade is no better than anything else. Retailers are very anxious to get as much coal moved as possible, but their customers do not respond. As a result the early fall trade should be good.

There is a fairly brisk movement by Lake and if the docks of the Upper Lakes will hold the coal it will continue to go forward. Actual sales are not brisk. Shipments by Lake for the week were 141,000 tons, nearly all to leading ports at the head of the Lakes.

TOLEDO

Lake business still quiet and domestic and steam trade light. Prices not very firm.

There is little movement as compared with other seasons although some coal is going up the Lakes. Both the domestic and steam trades are light. Prices are not holding very firm but it is the consensus of opinion that there is going to be more business in a short time. Some contracts are being let but they are mostly small. Few of the large contracts have as yet been let or even offered. Pocahontas coal is still hard to secure in prepared sizes and prices are high. West Virginia and Kentucky grades are in fair demand and there is commencing to be some movement of Pittsburgh No. 8 Youghiogheny, and Cambridge coal is moving as well as could be expected in the low state of the market.

CINCINNATI

Better demand for steam coal for immediate delivery, but contracting is slow and at lower prices.

It is reported that there is a better demand for fuel than for some time, due to increased operations at many industrial concerns. This is evidenced by some orders received for the resumption of contract shipments in full volume. While these signs of improvement are encouraging, the fact remains that all departments of the market are overcrowded. The domestic situation is still technically strong, but buying is negligible.

COLUMBUS

Prices appear firmer. Some slight stir in stocking is reported although the general dullness still continues. Lake movement still light but increasing slowly.

Some demand for stocking purposes is reported in the Ohio coal trade during the past week. This feature coupled with an increased Lake trade has made the market a trifle more active. But on the whole the situation is still dull and little hope for improvement is seen in the immediate future.

Stocking of Pocahontas and West Virginia splints is noted in limited quantities. Some of the producers report a slight increase in the demand for Hocking, but the stocking period on that variety does not develop until later. Rural dealers are laying in a better stock to take care of the threshing trade which is expected soon and that has an effect. Retail trade is slow although prices are still well maintained, Pocahontas lump is firm at $4 while mine-run is selling around $3.50. West Virginia splints and White Ash are also firm. Retailers' stocks are only fair in most localities.

Steam business is still slow in all sections. Manufacturing continues at a low ebb and requisitions are limited. A large part of the buying for steam consumption is off the open market at cheap figures. Contracting is attended with difficulties. Railroads are taking only a fair tonnage, as freight movement is still limited.

Lake trade is increasing slowly but no great tonnage is moving from Ohio mines to the Northwest. Docks in the Upper Lake ports are still congested.

Circular prices on the whole are fairly well maintained and on some grades a firmer tone is noted. Ohio producers have come to the conclusion that it is better to leave the coal in the ground than to sell at a loss. Consequently the extremely cheap coal offered in former years is not available. West Virginia producers are still offering rather cheap prices in Ohio markets.

Mines have been working at about the following percentages of full capacity:

	Week Ended					Week Ended			
District	May 22	May 29	June 5	June 12	District	May 22	May 29	June 5	June 12
Hocking...	25	30	30	25	Cambridge.	30	35	35	35
Jackson....	25	20	20	20	Masillon...	35	35	35	40
Pomeroy...	50	45	50	50	Eastern O..	5	15	25	30
Crooksville.	30	35	35	30					

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump.............	$1.45	$1.50	.....
Inch and a quarter............	1.30	1.35	$1.30
Three-quarter inch............	1.25	1.30	1.25
Nut........................	1.15	1.25	1.15
Mine-run...	1.05	1.10	1.05
Nut, pea and slack...........	.70	.75	.65
Coarse slack.................	.60	.70	.55

CLEVELAND

Market showing a tendency to weaken and all prices are off 5c. Brokers holding quotations by taking up all cheap coal. Lake shipping remains unchanged.

Fine coals sold from $1.45 to $1.50 at the opening of the week, and the demand was hardly equal to receipts. Only about 300 cars were on track Monday and the only reason prices remained where they were was because brokers were ready to buy anything that was offered at less. They were confident they could make a profit if the coal was newly received and had a day or two between car service.

Coarse coals are also lower and shipment prices are the same as spot. No. 8 and Middle district spot coals were about at par with three-quarter and offered at $1.75; it seemed as if everything left over had been dumped into this market.

Were Lake shipments larger there would not be so much cheap coal in Cleveland. The Lake shippers are preparing to send more coal to the Northwest as soon as there is a demand for harvesting, but they are holding back to avoid piling new coal on that carried over from last year.

Hard coal shipments to the Lake are up to last year, but this is due to the light demand from all-rail customers. Dealers are not stocking, complaining that they have not been able to collect last year's accounts and could not pay for the coal if they took it.

Prices for shipment are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8
Lump.........	$3.10	......	......	....	......
Lump, ¾ in.....	.....	$2.15	$1.95	$1.85@1.90	$1.80@1.90
Egg...........	3.10	......	......	....	......
Mine run.......	2.65@2.70	2.05@2.10	1.80	1.80	1.75@1.85
Slack..........	......	1.60	1.50	1.50	1.50

LOUISVILLE

Market continues flat though there is somewhat more coal being stocked.

The stocking movement is somewhat more manifest, though it has not attained important proportions. Prices show no changes, except where there is price cutting, and are based on the following, which are the schedule for the month: Block, $1.50; round, $1.20; steam run-of-mine, $1; six-inch round, 95c.; four-inch round, 85c.; nut and slack, 45 to 60c.

MIDDLE WESTERN

GENERAL REVIEW

Buying continues slow and consumption light. Screenings strong. Domestic coals in no demand. Anthracite movement stronger.

Prices are approximately on the same basis and are still being fairly well maintained notwithstanding the inactivity. No appreciable increase in the demand for domestic sizes is noted, although there is a certain amount of buying of various grades to cover immediate requirements. Indiana and Illinois operators are figuring on advancing prices about July 1 because the movement of storage coal has begun and increased buying for June delivery is expected.

Incoming shipments of free coal are not excessive, and are readily disposed of, so that there is little coal on demurrage. The railroads are still taking less than normal amounts, and the demand from manufacturing plants is also restricted. Industries manufacturing war materials are booming, but their individual prosperity does not create in general an increased demand for coal.

CHICAGO

Screenings somewhat softer. Operations generally curtailed. Shortage of Eastern coals. Anthracite market better.

There is more domestic lump being sold from southern Illinois mines at $1.35 than at less, and indications are that this price will be the ruling figure for the balance of the month. Screenings from this section have softened somewhat, holding at about 5c. per ton less than last week. There is some buying of threshing coal from Williamson County mines and steam sizes have been in fair demand.

Increased orders have been placed with Harrisburg and Saline County operators for steam sizes, but screenings have been easier.

The Indiana operators are producing barely enough coal to supply the demand.

The prepared grades of West Virginia smokeless coals continue scarce and high, and few offerings are made. Third Vein and Pocahontas lump are at a high level, and difficulty is experienced in obtaining prompt shipment. Almost all high-grade Eastern coals are gaing strength slowly.

There is an excessive amount of splint coal offered.

There is little activity in Hocking, although very little free coal is on the market. Prices are well held considering the lack of demand.

Eastern Kentucky operators are still forcing coal on the market, with the result that prices are not on a profitable basis.

Improvement is noted in the anthracite demand. Retailers have been placing increased orders for current delivery, and there is a better movement to points beyond Chicago. Prices are well maintained notwithstanding the demoralization in the East.

ST. LOUIS

Screenings softer and there is not enough tonnage moving to create any stir. Improved outlook in the inner group.

Not enough tonnage is moving this week to create any stir in the market. The demand for lump is scarcely perceptible. Screenings, which have been holding up well, eased off a little during the week, but not enough to shade the price and a recovery is expected next week. Some sales of lump were reported as low as 75c. There has been no change in the situation in the inner group, where ruinously low prices still prevail. There are indications, however, that the few operators who have stayed out of the selling agency plan on the Illinois Central will soon get into line and make possible a restoration of prices.

There is considerable speculation as to the influence that the opening of the St. Louis-Elkhart byproduct coke plant may have on the local situation. The company will begin delivering in the city and making shipments about June 25. It is expected to compete principally with anthracite. The price is 30% less than for hard coal but it is more expensive than soft coal. St. Louis dealers are taking it on and shipments are to be made to the Northwest and Southwest and to the Coast.

Quotations for the week are as follows:

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard
6-in. lump....................	$1.35@1.50	$1.25	$1.25	$0.90

KANSAS CITY

The wholesale prices remain unchanged and the market has been practically at a standstill all week. The factories and other large industries are still holding to the bottom of the market and it appears that they will do so all summer.

PORTLAND, ORE.

Coal business is quiet. Utah and Wyoming mines advance prices 25c. per ton.

Coal dealers here have been notified that the Utah and Wyoming mines have advanced prices 25c. per ton, making Wyoming coal bought for this district $2.50 per ton, and Utah coal $2.25. Storage prices are not quoted here for the present owing to these advances. Warm weather has set in and little demand is anticipated for domestic purposes until the season opens for next fall.

PRODUCTION AND TRANSPORTATION STATISTICS

VIRGINIAN RAILWAY

Shipments over this road for April of the current year amounted to 352,750 short tons as compared with 309,427 during the preceding month.

SAULT STE. MARIE

The bituminous shipments through the Sault Ste. Marie Canals for May of the current year amounted to 1,248,447 short tons and the anthracite shipments 248,110 short tons.

CHESAPEAKE & OHIO RY.

The following is a comparative statement of the coal and coke traffic from the New River, Kanawha and Kentucky districts for April and the ten months of the fiscal years 1914 and 1915, in short tons:

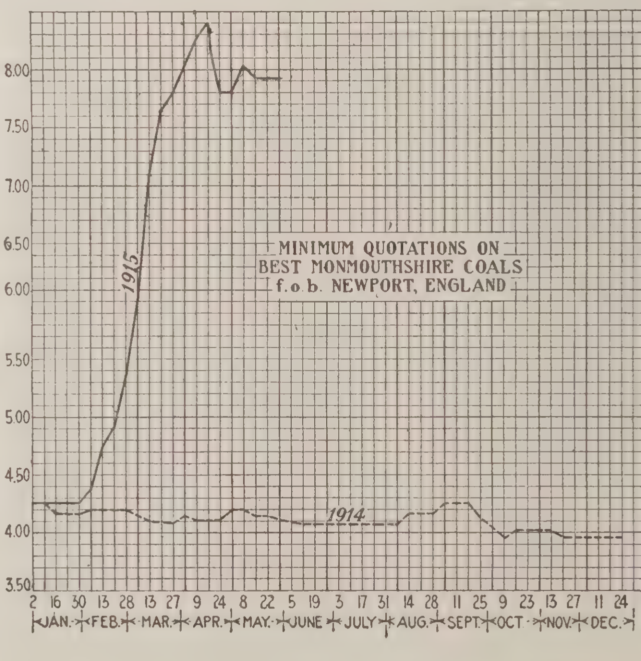
FOREIGN MARKETS

GREAT BRITAIN

Stocks continue short and consumers are concerned over the outlook. Licensing of exports working more smoothly.

Collieries are experiencing the trouble of restricted production through labor shortage, the outputs being in many cases quite inadequate to meet the demands of buyers, who are now becoming more concerned about the stocking for winter requirements. On the other hand, the export license difficulty is still a subject of great interest to some markets, though in this matter more satisfactory working is being experienced. Another concession which has been made is to the effect that where it is necessary to increase the quantity to be exported, the committee will allow a margin of 10 per cent., not to exceed 200 tons. Taken all round, it is admitted that the licensing regulations are working fairly well, though we understand that some are being refused in connection with the shipments under the recently concluded Swedish State Rys. contract. In the event of further licenses being refused under this contract, it is possible that the Swedish authorities may buy a further quantity of American coal.—"The Iron and Coal Trade Review."



Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
774	Dept. of the Interior	Washington	D. C.	38,869b	956
774	Dept. of the Interior	Washington	D. C.	4,947a	956
819	State Pur. Agt.	Austin	Tex.		1048
831	Board of Education	Portsmouth	Ohio	1,380b	1949
843	Bd. of County Comrs.	Columbus	Ohio	5,415b	1049
845	Bur. Supplies and Accts.	Washington	D. C.	300b	1050

aIndicates anthracite coal. bIndicates bituminous.

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

No. 236—New York, N. Y.—It is stated that the International Paper Co. is again in the market for 100,000 tons of bituminous coal to supply its various plants in different parts of the country. For previous announcement of this, see p. 447. Address Purch. Agt. C. E. Smith, 30 Broad St., New York, N. Y.

No. 691—Watervliet, N. Y.—The requirements on this contract (p. 877) have not yet been determined, the preliminary work necessary for fixing the tonnages required having not yet been completed. Address Col. W. W. Gibson, Watervliet Arsenal, Watervliet, N. Y.

+No. 706—New York—Bids on this contract (pp. 877, 915, 955, 1004, 1048) were opened on June 11. The coal bid on is to be used by 14 city departments. The bids were as follows:

	Egg	Stove	Nut	Broken	Pea	—Buckwheat—			Mine Run

+No. 751—Washington, D. C.—The anthracite bids received on this contract (p. 917), which provides for furnishing the Navy Department with coal (schedule 8288 Steam Engineering) during the fiscal year beginning June 30, were as follows: Cream Bros., 150 tons of broken, $5.35; 100 tons of stove, $6.89. J Maury Dove Co., 3000 tons of egg, $5.62; 150 tons of stove, $6.86; 300 tons of egg, $5.64; 500 tons of pea, $4.09. John C. Hancock & Co., 100 tons of stove, $6.70; 2000 tons of buckwheat, $4.50; 2000 tons of rice, $3. James H. Hill, 3000 tons of egg, $5.99; 300 tons of broken, $5.90; 150 tons of stove, $6.86. Lynah & Read, Inc., 3000 tons of egg, $5.59; 150 tons of stove, $6.30; 300 tons of egg, $5.70; 500 tons of pea, $4.10. Nottingham & Wrenn Co., 3000 tons of egg, $5.75; 150 tons of stove, $6.35; 300 tons of egg, $5.80; 500 tons of pea, $4.70; 300 tons of broken, $5.65. Marshall-Matlack Co., 150 tons of broken, $5.18; 3000 tons of egg, $4.25. William Nungasser, 250 tons of pea, $4.65. Geo. B. Newton Coal Co., 150 tons of broken, $5.78; 100 tons of stove, $6.88; 2000 tons of semibituminous, $3.60; 2000 tons of pea, $4.37; 2000 tons of buckwheat, $2.95; 2000 tons of rice, $2.45; 2000 tons of barley, $2.35. J. W. Peale, 2000 tons of pea, $3.95 until Oct. 31 and $4.30 thereafter; 2000 tons of broken, $5.57. Philadelphia & Reading Coal & Iron Co., 3000 tons of egg, $5.69; 150 tons of stove, $6.36; 300 tons of egg, $5.69; 500 tons of pea, $4.16. E. B. Townsend Coal Co., 100 tons of stove, $6.90; 150 tons stove, $6.99; 325 tons of egg, $6.90. Seymour Coal Co., 2000 tons of pea, $4.07½. Weston, Dodson Co., 2000 tons of pea, $4.19; 3000 tons of egg, $5.45; 150 tons of stove, $7; 300 tons of egg, $5.55; 500 tons of pea, $4.09. Wellington-Wild Coal Co., 100 tons of stove, $7.10; 325 tons of egg, $7.10. Whitney & Kemmerer Co., 250 tons of pea, $4.15; 2000 tons of semi-bituminous, $3.58. Address Paymaster Gen. U. S. Navy Samuel McGowan, Washington, D. C.

No. 802—Boston, Mass.—This contract (p. 1005), which provides for furnishing the Bay State Street Ry. Co. with 155,000 tons of high-grade steam coal, has not yet been closed, although bids were asked for early in June. Deliveries are at various points, but mostly on tidewater at such places as Beverly, Chelsea, Lynn, Quincy Point, Mass., and Newport and Portsmouth, R. I. Several shippers are actively competing for this order and it will be a matter of great interest to the trade to see whether it is awarded on Southern coals or on grades from Pennsylvania; there is an impression it will probably be divided between the two. This contract will give a further line on a rather mixed market at an interesting stage. Shipments will be made by water at most of the plants. About 4000 tons of the requirements are anthracite. Shipments are to be made as required on monthly notice. Address A. P. Emmons, Bay State Ry. Co., 84 State St., Boston, Mass.

No. 839—Hoboken, N. J.—The requirements on this contract (p. 1049), which provides for furnishing the local Board of Education with coal during the ensuing year, are about as follows, the prices given being those at which the contract for the past year was filled: 900 tons egg coal, $5.36; 250 tons stove coal, $5.36; 300 tons nut coal, $5.61. Address Business Mgr. R. A. Marnell, Bd. of Edu., Hoboken, N. J.

New Business

No. 850—Skowhegan, Maine—The Somerset Worsted Mills at this place usually contracts for its coal requirements during the current month. About 14 tons per week are required and deliveries are made by water, railroad and team. Georges Creek coal is being used at present, and the company has a storage capacity of 150 tons. Address Pur. Agt. Ralph Gledhill, R. F. D. No. 4, Skowhegan, Maine.

No. 851—Kingston, Ontario, Can.—The School of Mines at this place is requesting bids for 2000 tons of slack coal, the ash content of which must not exceed 15%. Delivery is to be made on dock at Kingston before Sept. 1. Address School of Mines, Kingston, Ontario, Can.

+No. 852—Canal Dover, Ohio—The Public Service Department at this place will be in the market some time in July for from 1500 to 1700 tons of bituminous mine-run coal. The business is let on competitive bids and usually goes at about $1.60 at the plant. Address Dir. Osmond Salmon, Pub. Service Com., Canal Dover, Ohio.

+No. 853—Boise, Idaho—The Idaho State Board of Education will receive bids until June 21 for furnishing approximately 4500 tons of coal during the next school year. Specifications may be had on application, and bids should cover cost of delivery in the bins of the Idaho state educational institutions. Address Auditor and Bus. Agt. Ralph T. Bickell, State Bd. of Edu., Boise, Idaho.

+No. 854—Tompkinsville, N. Y.—Sealed proposals will be received at the office of the Lighthouse Inspector, Tompkinsville, N. Y., for furnishing bituminous and anthracite coal at New York, New London, Conn., and Newport, R. I. Additional information may be obtained on application. Address Lighthouse Inspector, Tompkinsville, N. Y.

+No. 855—Wilmington, N. C.—Sealed proposals will be received at the office of the United States Engineer, Wilmington, N. C., until June 28, for furnishing about 13,000 tons of bituminous coal. Further information may be had on application. Address U. S. Engineer, Wilmington, N. C.

+No. 856—Kansas City—The Board of Education at this place will be in the market about July 1 for their annual requirement of coal. About 2800 or 2900 tons of semianthracite is used, which is usually bought at $5.34 per ton, and 3900 tons of bituminous at $3.74 per ton. The business is let on competitive bids, which are requested by circular letter to all dealers. Address Board of Education, Kansas City, Mo.

No. 857—Fairport, N. Y.—The Sanitary Can Co. at this place is requesting bids for 1000 tons of buckwheat, and 1000 tons of slack coal for its plant at Fairport, N. Y. Address Pur. Agt. Sanitary Can Co., Fairport, N. Y.

+No. 858—Middletown, Ohio—The local Board of Education will receive bids until 7 p.m., June 25, for furnishing approximately 800 tons of mine-run coal, which will run 60% lump or better. The coal must be equal to or better than Chesapeake, Red Jacket, Thacker, Raymond City, Majestic, Winifrede, Acme, Island Creek or Eureka Block. Bids should cover cost of delivery to the various buildings as required. All proposals must be accompanied by a certified check for $150. Address C. W. Denny, Supply Com., Bd. of Edu., Middletown, Ohio.

+No. 859—Syracuse, N. Y.—The Board of Contract and Supply will be in the market on July 1 for about 7000 tons of anthracite coal, the business going usually on about the following basis: Grate, $5.17; egg, $5.41; stove, $5.71; pea, $4.20; buckwheat, $3.24. The call for bids is advertised, and the business let on a competitive basis. Address Board of Contract and Supplies, Syracuse, N. Y.

+No. 860—Louisville, Ky.—Bids will be received until about the middle of August for supplying practically all of the city institutions with coal during the ensuing year. The current contract, which expires Aug. 31, is held by a number of coal companies, the Atlas Coal Co. having the contract for the City Hospital and Bryne & Speed the Workhouse. On the new contract the supplies for the Home for the Aged and Infirm and the Eruptive Hospital are to be quoted for delivery by rail. Address Asst. City Buyer J. E. Bean, Lousville, Ky.

+No. 861—Newberry, Mich.—Bids will be received at the Newberry State Hospital until 1 p.m., June 28, for furnishing approximately 6000 tons of bituminous and semibituminous coal as required during the ensuing year. Proposals and blank forms may be obtained on application. Address Secy. Dr. E. H. Campbell, Newberry State Hospital, Newberry, Mich.

+No. 862—Burlington, Iowa—Sealed bids will be received until 2 p.m., June 21, for furnishing Des Moines county with coal during the year beginning July 1. Bids are requested on lump coal and should be made f.o.b. West Burlington in carload lots, delivered at County Jail, and also delivered to the poor in ton and half-ton lots. Address County Auditor, F. W. Parrott, Burlington, Iowa.

+No. 863—Galesburg, Ill.—The Board of Education at this place will be in the market some time during July for approximately 2200 tons of lump coal and screenings for use at the school. The screenings are usually bought at $2.25 per ton and the lump coal at $2.69. The call for bids is advertised. Address Board of Education, Library Bldg., Galesburg, Ill.

+No. 864—Indianapolis, Ind.—The Board of Public Safety of this place will receive bids until June 23 for furnishing the coal requirements of the police headquarters and substations, and the same for the fire department. Various kinds of coal are used, including Pocahontas lump and mine-run, Kanawha lump, and Pittsburgh lump, all classes of anthracite, cannel, Indiana egg and nut, and some charcoal. The contract amounts to about $5000 a year. The coal is to be delivered as required at the various stations. Address Board of Public Safety, Indianapolis, Ind.

+No. 865—West Newton, Mass.—Sealed proposals will be received until 2:30 p.m., June 14, for furnishing the city with its fuel requirements, including the School, Street, Fire, Police, Charity and Library Departments. Proposals must be made out on blank forms, which may be obtained on application, and must be accompanied by a certified check for $200. A bond guaranteeing the faithful performance of the contract to the amount of $2000 will be required. Address Pub. Bldg. Comr. Walter R. Forbush, City Hall, West Newton, Mass.

+No. 866—Cleveland, Ohio—The Water-Works Department will have blank forms and specifications ready Sept. 15 on which to submit bids covering their coal requirements during the year beginning Sept. 30. This is the largest annual contract let in this city; it amounts to about $90,000 a year. The contract will be let on Oct. 1. Address City Purch. Agt., Water-Works Dept., Cleveland, Ohio.

+No. 867—Columbus, Ga.—The City Government at this place will be in the market some time during July for about 200 tons of coal for use of the City Fire Department and the Court House. Cahaba red ash coal is ordinarily used, which costs about $3.90 per ton delivered at the Court House. The business is let on competitive bids. Address City Clk. M. M. Moore, Columbus, Ga.

No. 868—Cincinnati, Ohio—City purchasing agent will receive bids until noon June 21 for furnishing the various city institutions with approximately 20,000 tons of coal during the ensuing year. Complete details, including specifications and proposal forms, may be obtained on application. Address City Purch. Agt. Ernst von Bargen, City Hall, Cincinnati, Ohio.

No. 869—Washington, Penn.—Board of Education will receive bids until 7:30 p.m. July 8 for furnishing their coal requirements during the ensuing year, involving approximately 20,000 bu. of 1¼ in. bituminous and 5000 bu. of slack. Separate proposals are also requested for delivery of the coal to the various school buildings. Address Secretary R. W. Mason, Board of Education, Washington, Penn.

✚**No. 870—Peoria, Ill.**—The Board of Education at this place will be in the market some time during July for about 5000 tons of bituminous (Springfield) lump coal, which is usually bought at $2.17 per ton. The call for bids is advertised. Address Board of School Inspectors, 203 City Hall, Peoria, Ill.

No. 871—Chicago, Ill.—The Atwood & Steele Co. at this place will probably be in the market some time during next month for two cars of Pocahontas mine-run coal. Address the Purchasing Agent, Atwood & Steele Co., Chicago, Ill.

✚**No. 872—Danbury, Conn.**—The Board of Education will be in the market some time during July for 650 tons of anthracite coal. The cost is usually $7 per ton delivered in bin. The call for bids is advertised. Address Secretary, Committee on Finance and Supplies, Board of Education, 81 West St., Danbury, Conn.

✚**No. 873—Springfield, Mo.**—The Board of Education here will be in the market some time in July for approximately 1400 tons of screened Kansas lump coal. The usual price is about $3.55 per ton. The business is let on competitive bids and the call for bids is advertised. Address Board of Education, Springfield, Mo.

✚**No. 874—Lima, Ohio**—The Board of Education here will contract some time in July for between 400 and 500 tons of white ash mine-run coal. The business is usually let at about $3.10 per ton. Address Purchasing Agent, Board of Education, 118 N. West St., Lima, Ohio.

✚**No. 875—Idaho Springs, Colo.**—The Boston-Colorado Power & Water Co. will be in the market some time in July for approximately 3500 tons of slack coal which is usually bought at about $2.50 per ton. It is stated that the business is not done on competitive bids. Address Purchasing Agent, Boston-Colorado Power & Water Co., Idaho Springs, Colo.

✚**No. 876—New Albany, Ind.**—The School Board at this place will be in the market some time next month for approximately 700 tons of mine-run coal which is usually bought at about $3 per ton. The business is done on competitive bids, which are invited by circulars to the local dealers. Address Board of School Trustees, Spring St., New Albany, Ind.

✚**No. 877—Miamisburg, Ohio**—The local Power Department will be in the market some time in July for approximately 2500 tons of West Virginia coal, which is usually bought at $2.15 per ton on track. The business is done on a competitive basis. Address Frank DeWitt, Water Works Dept., Miamisburg, Ohio.

No. 878—Marianna, Ark.—The Marianna Electric Co. at this place will be in the market some time in July for 1500 tons of pea and slack coal which is usually bought for about $2.50 per ton. The business is done on a competitive basis. Address Mgr. J. B. Campbell, Marianna Electric Co., Marianna, Ark.

✚**No. 879—Peabody, Mass.**—The Electric Light Department at this place will be in the market during July for approximately 3200 tons of Pocahontas coal which is usually bought at about $4.47 per ton delivered in front of the boiler. The coal is bought on competitive bids. Address Mgr. Warren D. King, Peabody Electric Light Dept., Peabody, Mass.

✚**No. 880—Carthage, Mo.**—The Carthage Water and Electric plant will be in the market some time during July for approximately 5400 tons of Cherokee slack which is usually bought at about $1.90 per ton delivered in the bin. The business is done on a competitive basis. Address Supt. A. P. Knowles, Carthage Water and Electric Plant, Carthage, Mo.

✚**No. 881—Battle Creek, Mich.**—The Board of Education at this place received bids until noon of June 16 for furnishing 2000 tons of Pocahontas mine-run, 200 tons Massillon domestic lump and 200 tons of anthracite furnace coal. A certified check for $250 was required with all bids and a bond not to exceed $3000 must be furnished by the successful bidder. Bids are to cover cost of delivery in the bins at the various school buildings. Approximately 700 tons of coal may be delivered before Sept. 1. No bids will be accepted on coal running less than 14,800 B.t.u. and analysis must in all cases accompany each bid. Address Secy. F. A. Allwardt, Bd. of Edu. Battle Creek, Mich.

✚**No. 882—Tracy, Minn.**—The Board of Education at this place received bids until 8 p.m., June 17, for 300 tons of screened Youghiogheny lump coal, to be delivered at the various school buildings as required during the period from July 1 of the current year until June 1, 1916. Address Clk. C. C. Richard, Bd. of Edu., Tracy, Minn.

✚**No. 883—Trenton, N. J.**—Bids will be received until 7:30 p.m., June 22, for furnishing and delivering 400 gross tons of anthracite pea and 25 tons of stove coal to the Court House, as may be required. Address Chn. John J. McCartan, Trenton, N. J.

✚**No. 884—Ottawa, Can.**—The city clerk at this place received bids until June 10 for furnishing 250 tons of the best quality of anthracite egg coal to be delivered at the County Jail and Court House. Address County Clk. Chas. MacNab, Ottawa, Can.

✚**No. 885—Detroit, Mich.**—Sealed proposals will be received at the office of the Lighthouse Inspector for furnishing fuel for lighthouse vessels, during the fiscal year ending June 30, 1916. Blank proposals and particulars may be obtained on application. Address Lighthouse Inspector, Detroit, Mich.

✚**No. 886—Manchester, Ohio**—The B. P. Stone Electric Light Plant at this place may contract at any time for their annual requirements of coal involving about 700 tons of mine-run. The usual price is about $2.10 per ton delivered, and the coal is subjected to tests before purchasing. Address B. P. Stone, Electric Light Plant, Manchester, Ohio.

✚**No. 887—Binghamton, N. Y.**—The City Government at this place will contract some time during the summer for approximately 2000 tons of anthracite and bituminous coal. The call for bids is advertised. A contract is always made by the Department of Public Works, and purchases in the open market are occasionally made by the Board of Education. Address Department of Public Works, Binghamton, N. Y.

No. 888—Fairbury, Neb.—The G. D. Meyers Water & Light Co. of this place usually contracts some time in the spring for about 2000 tons of Weir nut coal at approximately $2.95 per ton, delivered in the bin. The business is let on a competitive basis. Address G. D. Meyers Water & Light Commission, Fairbury, Neb.

No. 889—North Billerica, Mass.—The Talbot Mills at this place consumes about 3000 to 3500 tons of coal per annum. Consumption is at the rate of 100 tons per day during certain periods and deliveries are made by railroad and wagon. The company has a storage capacity of 2000 tons and when not confining purchases to the open market, they contract in June or July. Address Treas. Thomas T. Clark, Talbot Mills, North Billerica, Mass.

✚**No. 890—Aurora, Ind.**—The Indiana Public Service Co. at this place consumes about 3000 tons of Pittsburgh nut and slack coal per annum. It is understood that the business is not let on competitive bids, and the price is usually about $2.06 per ton. Address C. B. Harring, Indiana Public Service Co., Aurora, Ind.

No. 891—Comanche, Tex.—The Comanche Light & Power Co. consumes approximately 1350 tons of Texas lignite per annum, which is usually bought at $1.75 per ton. The business is done on competitive bids but no particular time is specified for contracting. Address Mgr. E. W. Harris, Comanche Light & Power Co., Comanche, Tex.

✚**No. 892—Jacksonville, Fla.**—Sealed proposals will be received at the office of the U. S. Engineers at this place, until June 28, for furnishing 4000 tons of coal. Bids will also be received until June 30, for furnishing an additional 3000 tons of coal. Complete details and full information may be obtained on application. Address U. S. Engineer's Office, Jacksonville, Fla.

✚**No. 893—Milwaukee, Wis.**—Sealed proposals will be received at the office of the Lighthouse Inspector at this place for furnishing fuel. Complete details may be had on application. Address Lighthouse Inspector, Milwaukee, Wis.

✚**No. 894—Richmond, Ind.**—The Board of Public Safety at this place will receive bids until July 1 for furnishing coal of various kinds. The total contract will probably amount to more than $10,000. Address Pres. Alfred Davis, Bd. of Pub. Safety, Richmond, Ind.

✚**No. 895—Monticello, Ind.**—The County Commissioners at this place will receive bids until July 6 for furnishing the coal supply for the court house, jail and country asylum. Address Audr. A. G. Fisher, Bd. of County Comrs., Monticello, Ind.

✚**No. 896—Indianapolis, Ind.**—The Board of Trustees of the Indiana Women's Prison will receive bids until July 1 for furnishing 1500 tons of coal, to be delivered between Oct. 1, 1915, and Sept. 30, 1916. The bid must be accompanied by analysis, showing the ash and B.t.u. Smokeless will be given preference, other conditions being equal. The coal will be paid for on the basis of the price named, corrected for variation in heating value and ash as shown by analysis. A certified check for $500 must accompany each bid. Address Board of Trustees, Indiana Woman's Prison, Indianapolis, Ind.

+No. 897—Lyndhurst, N. J.—The Board of Education of this place will receive bids until 8:15 p.m., June 24, for furnishing about 90 tons of egg and 250 tons of pea coal to the local schools, deliveries to be made as required. Address District Clk. William J. Liston, Bd. of Edu., Lyndhurst, N. J.

+No. 898—Ann Arbor, Mich.—Bids were received until 5 p.m., June 17, for furnishing the local City Government with 60 tons of egg coal for immediate delivery at the City Hall bins, 40 tons of nut coal to be delivered as required at the Engine House, one carload of Virginia splint coal, and one carload of chestnut coke to be delivered at city yards. Address City Clk. Ross Granger, Ann Arbor, Mich.

No. 899—Plymouth, Mass.—The Standish Worsted Co. at this place usually contracts about June 1 for its annual requirements of coal, amounting to approximately 1500 tons of bituminous. Deliveries are made by wagon at the rate of about five tons per day, the storage capacity being limited to only 20 tons. Address Pres. E. H. Dorr, the Standish Worsted Co., Billington St., Plymouth, Mass.

+No. 900—Liberty, Ind.—The local Municipal Government will receive bids until June 24 for furnishing three cars of Island Creek mine-run coal. Address Town Clk. R. M. Duvall, Liberty, Ind.

No. 901—Crafton, Penn.—Sealed proposals will be received until noon, June 21, for furnishing the local schools with the best Panhandle lump, nut and slack coal during the school year beginning July 5. Address Secy. L. F. Wentz, 425 Fourth Ave., Pittsburgh, Penn.

+No. 902—St. Bernard, Ohio—The Director of Public Service at this place will receive bids until noon, June 21, for furnishing 3600 tons of coal for use at the Water Works and Electric Light Plant during the year beginning July 1. Quotations should be made f.o.b. side track in the rear of the Electric Light plant. Bids should be for straight nut and slack coal and on the basis of short tons. A certified check for $100 must accompany all bids and a satisfactory bond guaranteeing the fulfillment of the contract will be required. Address Secy. Harry Vanden Eynden, Public Service, City Hall, St. Bernard, Ohio.

+No. 903—Charleston, S. C.—The Board of Education at this place will receive bids until noon, June 30, for furnishing the public schools with 100 tons red ash stove and 45 tons Pocahontas coal during the ensuing year. Address Supt. A. B. Rhett, Bd. of Edu., Charleston, S. C.

+No. 904—Uniontown, Penn.—The Board of Education at this place will receive bids until 5 p.m., June 25, for furnishing the school buildings with their coal and coke requirements during the ensuing year. Address C. L. Davidson, Schools District of Uniontown Borough, Uniontown, Penn.

There were seven bidders on the contract. Address Clk. H. H. Eagon, Bd. of Edu., Newcomerstown, Ohio.

+No. 809—Colfax, Wash.—This contract (p. 1006), which provides for furnishing the Whitman County Government with coal, has been awarded to the **Standard Lumber Co.**, at from $7.45 to $7.95 per ton. Address County Audr. A. R. Metz, Colfax, Wash.

+No. 836—Trenton, N. J.—This contract (p. 1049) has been awarded to **Robert W. Kennedy** at $2126.90. Other bids on this contract were: Phil J. Campbell, $2153.50; the Tattersall Co., $2139; Wilson & Stokes, $2148; J. E. Stevenson Co., $2136.70. Address Clk. E. F. Lamson, State Bd. of Edu., Trenton, N. J.

Contract Notes

Lowell, Mass.—The United States Bunting Co. at this place consumes about 5000 tons of New River coal per year.

Hope Valley, R. I.—The Mystic Woolen Co. consumes about 900 tons of steam coal per year. Deliveries are made by rail.

Union City, Ind.—The S. J. Patterson Co. at this place received the contract for furnishing coal for the water-works plant.

Sheboygan, Wis.—The local Board of Education uses about 900 tons of anthracite and Hocking coal a year. The call for bids is advertised and the business let to the lowest bidder.

Du Quoin, Ill.—The Du Quoin Utility Co. consumes from 10,000 to 12,000 tons of screenings per year which cost from 40c. to $1.10 per ton. The coal is purchased in the open market entirely.

Dexter, Me.—Amos Abbott Co. at this place consumes about 1500 tons of bituminous coal per year. They have a storage capacity of 600 tons and deliveries are made by water and railroad.

Weehawken, N. J.—The Board of Education of this place has awarded the contract for supplying the local schools with egg coal during the ensuing year to the **Consumers' Coal Co.**, at $5.49 per ton.

Redfield, S. D.—The Municipal Light Plant at this place consumes approximately 1000 tons of Elkhorn screenings per annum which is bought at about $5.10 per ton. The business is done on competitive bids but there are no contracts.

Alpena, Mich.—The Alpena Water & Light Department consumes from 1800 to 2000 tons of slack coal per year which usually costs about $2 per ton. The city buys exclusively in the open market. Address Supt. Allwin C. Calkins, Alpena, Mich.

Fremont, Neb.—The City Water & Light Department purchases about 8000 tons of South Kansas screenings per year at from $2.25 to $3.35 per ton. The coal is bought in the open market and is not open to competition. Address Comr. L. D. Wright, City Water & Light Dept., Fremont, Neb.

Buffalo, N. Y.—Supt. C. L. Hyde, of the J. N. Adam Memorial Hospital, reports to the Common Council that the lowest responsible bid for bituminous three-quarter, f.o.b. cars at Perrysburg, N. Y., is $2.20 net, by the Punxsutawney Coal Mining Co. of Buffalo, and recommends that a contract be made.

Wahoo, Neb.—The Wahoo Municipal Light & Water Department consumes about 1800 tons of Kansas slack per year which usually costs about $3.02 in the bin. The coal is bought in the open market but not on competitive bids. Address Supt. H. M. Robertson, Wahoo Municipal Light & Water Dept., Wahoo, Neb.

Los Animas, Colo.—The bids on the contract for furnishing the Naval Hospital at this place with coal were as follows: Five thousand tons of mine-run steaming coal: Cedar Hill Coal & Coke Co., $3.80; Joseph Chilberg, $2.75 or $1.50 f.o.b. Morley; Swastika Fuel Co., $2.80. Six hundred tons, Cañon City lump: Cedar Hill Coal & Coke Co., $5.05; Joseph Chilberg, $5.10 or $2.75 f.o.b. mine.

Knighstown, Ind.—The Ohio & Kentucky Coal Co. of Toledo failed to secure for the second season the contract for furnishing 6000 tons of fuel for the Indiana Soldiers' and Sailors' Orphans' Home, which was recently let to an Indiana firm. The Ohio & Kentucky Coal Co. had the contract last season and made a remarkable record on West Virginia coal. Civic pride seems to have caused a return to the Indiana coal, according to the Toledo firm.

Boston—While the New Haven R.R. was in the market the latter part of May for up to 250,000 tons of high volatile coal, and through the Connecticut Co. for 150,000 more, the invitations did not get to shippers generally and so far as reported the orders have been placed with the New England Coal & Coke Co. as was generally anticipated. This makes considerably in excess of a million tons the New Haven R.R. has bought of one concern the current year.

St. Louis—The contract for furnishing the Blackmer & Post Pipe Co. for the year ending next April has been awarded to the St. Louis & O'Fallon Coal Co. The company takes from 75 to 100 cars a month. The St. Louis & O'Fallon Co. had the contract last year. The terms of the new contract are not divulged but they are understood to be more favorable to the coal company than the one of last year, when lump was furnished at a very low figure. It calls this year for mine run. The Blackmer & Post Co. plans to store coal in anticipation of a strike this year.

The Chesapeake & Ohio Makes a New Record at Hampton Roads—A new record for rapid coal loading at the Chesapeake & Ohio piers was made on May 30 when the steamship "Everett" was loaded and bunkered with 141 railroad cars in 2 hr. and 45 min. The coal was dumped at the rate of 51.2 railroad cars per hour or at the rate of one per minute. There were 7280 tons of cargo coal loaded, and 189 tons of bunker coal. This record was made at pier No. 9, and the coal was loaded for the account of the New River Coal Co., with their G. H. Caperton coal.

Foreign

Spain—Cable reports under date of June 16 are to the effect that a critical situation in the fuel supply has only been avoided by the arrival of American coal.

Italy—Press reports are to the effect that Walter L. Loeb, the New York representative of an important Genoese firm, is inquiring for a large tonnage of soft coal. It is stated that the tonnage involved is about 100,000 tons.

Egypt—An American consular officer in Cairo, Egypt, transmits specifications for the supply of 360,000 metric tons of coal for the Egyptian State Rys. The specifications may be examined at the Bureau of Foreign and Domestic Commerce or its branch offices. The information is furnished by the General Manager of the Egyptian State Ry., Cairo.

South America—Supplementing Foreign Trade Opportunity No. 16,496 and Confidential Circular No. 631, the Commercial Attaché of the Department of Commerce in South America transmits a detailed report relative to an opportunity for the sale of coal. His report may be examined at the Bureau of Foreign and Domestic Commerce or its branch offices. (No. 16,957.)

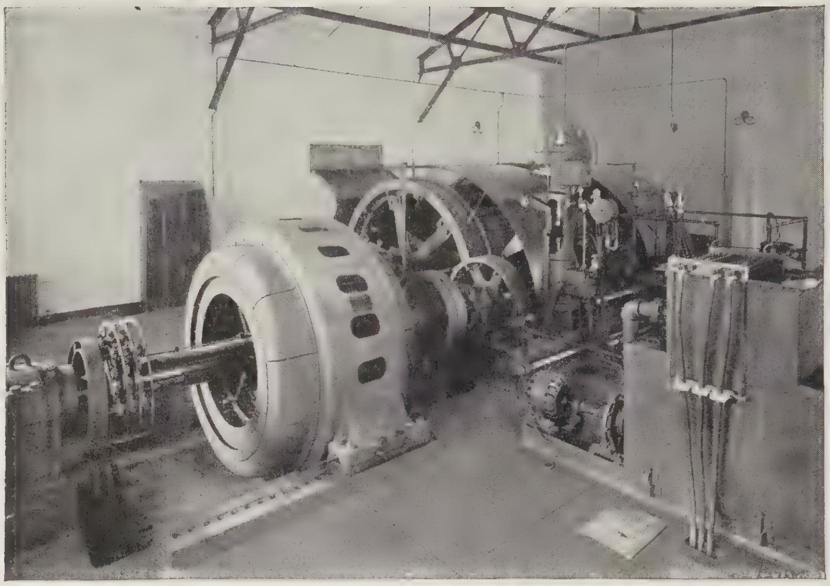
A Coal Outcrop on Lignite Creek in the Nenana Coal Field of Alaska



Lehigh Coal & Navigation Co., Lansford, Pa., 800 HP. Type CW Hoist Motor with Liquid Rheostat, driving double drum balanced hoist.

It All Depends on the Hoisting Equipment

Insure your hoist against shutdowns by driving it with Westinghouse Alternating-Current Hoisting Motors type CI or CW equipped with the newest safety devices. These Motors have been built especially for Hoisting and have been thoroughly tried in service and found to be reliable in every particular.

Our engineers are familiar with all types of hoisting problems, large or small. They designed the two largest installations in the United States using induction motors—

The Lehigh Coal & Navigation Company, Lansford, Pa.
The North Butte Mining Company, Butte, Mont.

They are at your service to solve your hoisting problems.

Our booklet Electric Drive for Mine Hoists No. 3113 gives data on large Hoisting Problems. Send for it.

RUN-OF-MINE TALKS

ON YOUR BUSINESS AND OURS

By the Business Manager

MUCH has been said on this page about the necessity of the man in charge of a modern coal mine keeping himself strictly up to date on all subjects connected with mining.

An example of how well this necessity is understood comes to hand in a letter from Lafayette Tuck, Supt., of the Homer City Coal Co., Homer City, Pa.

Says Mr. Tuck:—"We have used Coal Age for the past two or three years and I want to express my appreciation of it.

"Each copy is looked forward to and eagerly read from cover to cover, the advertising pages I believe, receiving the most attention.

"We have recently bought Waterbury wire rope and have sent for catalogs from several pump companies.

"I would like very much to see a discussion on small mine pumps, in Coal Age, as this is a subject that is not fully enough covered for small mines."

THINK of the advantages you have today!

Mr. Tuck wants to know more about small mine pumps. He looks through Coal Age and asks the pump advertisers to give him information. Immediately printed data will be sent him and for any special pumping problems, the engineers of the pump manufacturers are at his service. Besides he asks us to put the question up to our 10,000 readers for discussion.

Could there be a more complete information service imagined than that which is always available to you men in the coal mining industry?

Assuredly it is true that you must keep yourself posted on all that is going on in the progress of coal mining, but it is equally true that you have in your grasp all the necessary means for so doing—at no expense and with no trouble.

Are you making use of the "information service" that is offered you in every issue of your paper?

COAL AGE

Vol. 7 NEW YORK, JUNE 26, 1915 No. 26

The Long Life of Coal Miners

That the life of the miner is laborious but is not unhealthy is proved by the large number of old men in and around the mines, many of whom started work long before what is now the legal age. The risks of accident seem to be more than overbalanced by the immunities from disease.

For many years imagination peopled the mines with "noxious humors." The mine current was considered as harmful as night air—an atmosphere to be shunned. Meanwhile the miners throve in it. It is only recently that analyses have proved it free from bacteria and reason has pointed out that its temperature in its degree and equability is such as to produce the best conditions for the development of unfailing health. Like night, mountain and sea air the atmosphere of the mine is now vindicated even though its healthfulness has not yet been extolled.

VETERAN ANTHRACITE MINERS OF WILKES-BARRE, PENN.

Mark Ford has recalled that at the Washington colliery in England six of the men died at an aggregate age of over 438 years. Thus the men reached an average of over 73 years.

But this record is bettered by the five men in the picture from the William Penn colliery of the Susquehanna Coal Co., Wilkes-Barre, Penn. In 1912 they were still living and working and the average of their ages was nearly 73 years. On his feet on the left is Charles G. Palmer, a miner then at that age. This man had been with the company 41 years. He has recently died at the ripe old age of 75. Standing at his side is Philip H. Jones, a fireboss, aged 73 years. He had been on the rolls of the company for 41 years. Seated from left to right are William Jones, Sr., a miner aged 75 years, service 44 years, William J. Selzer, shipper, age 68 years, service 32 years, and James Malloy, miner, age 73, service 43 years.

At the series of examinations on the mine law in progress among the employees occupying responsible positions in the mines of the Susquehanna Coal Co., each man was asked how long he had been in its employ. Only three of the five divisions have so far reported. In these, one man had been with the company for 50 years, one for 48 years, 16 for over 40 years, 47 from 30 to 40 years, and 96 from 20 to 30 years. It should be remembered that the foregoing figures refer to the service of these men with the Susquehanna Coal Co. alone, and that most of them had worked additional years in the mines elsewhere.

In the Shamokin division the average length of service of 140 men was just short of 19 years; in the Wyoming division 63 men had served an average of nearly 25 years; and in the Lykens division 59 men had been in the employ of the company for 24¾ years.

Some of the longevity of the Susquehanna men may be due in part to the healthfulness of the anthracite region, situated as it is in a temperate clime and at a considerable elevation, but much is also due to the hardiness which the mine worker derives from his work and to the healthfulness of the atmosphere in which he performs his labor.

Coal Preparation in Oklahoma

By George M. Brown*

SYNOPSIS—Oklahoma produces about 3,700,000 tons of coal annually, of which about 2,000,000 tons is prepared for market, while the balance is sold as run-of-mine. Three grades—lump, nut, and a mixture of pea and slack—are ordinarily made. Washing is sometimes resorted to in preparing the small sizes.

Oklahoma is divided into three mining districts. District No. 1 is composed of 27 counties, of which Coal, Latimer and LeFlore produce nearly, if not all, of the coal mined in the district. District No. 2 embraces 26 counties; nearly all of the coal is produced in Pittsburgh County. District No. 3 has only two counties among 22 that produce much coal; these are Haskell and Okmulgee.

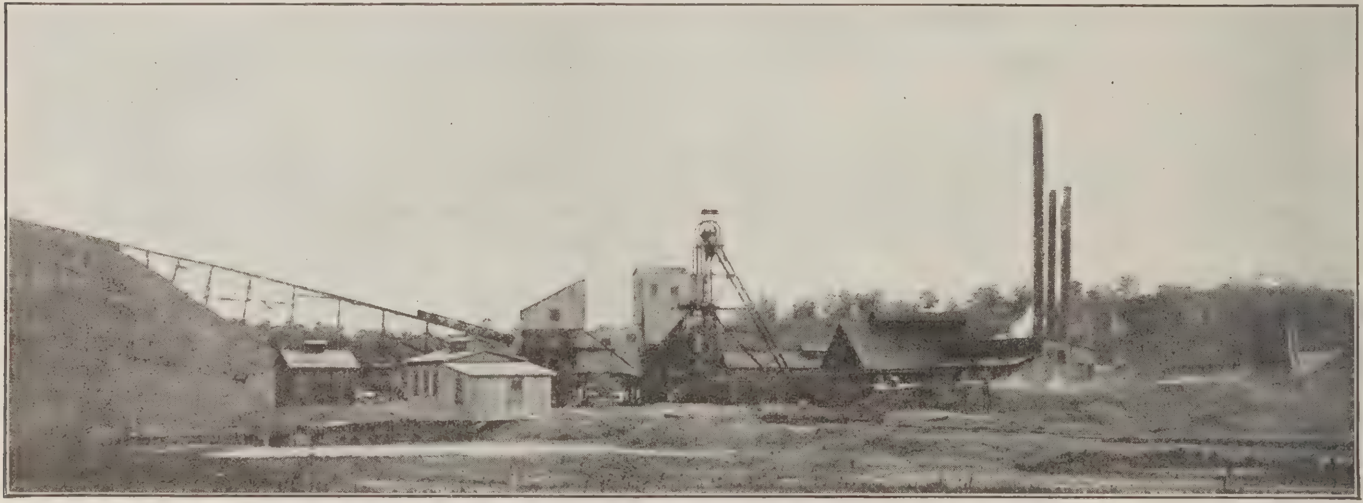

Fig. 1. Modern Plant in Eastern Oklahoma, Mine No. 5, Rock Island Coal Mining Co., at Alderson

The production of coal in Oklahoma from July 1, 1913, to June 30, 1914, was about 3,700,000 tons, according to figures in the state mine inspector's office. The pick-mined coal, or rather the coal shot off the solid, amounted to 3,019,334 tons distributed as follows:

District	Lump	Nut	Pea-Slack	Mine-Run
1	214,141	51,455	101,075	1,097,359
2	379,321	99,411	284,367	358,742
3	43,476	21,394	49,968	318,625
Totals	636,938	172,260	435,410	1,774,726
Percentage	51.2	13.8	35.0	

The machine-mined coal had a large increase over 1912-1913 and amounted to about 685,000 tons, divided as follows:

District	Lump	Nut	Pea-Slack	Mine-Run
1	58,990	20,000*	21,593	15,964
2	43,977	8,446	23,998	89,787
3	99,768	39,796	67,026	197,127
Totals	202,735	68,242	112,617	302,878

*Estimated.

These figures give the reader an idea of the preparation of the coal as regards trade names. In general the coal is treated as follows:

At most of the larger mines the coal is prepared by passing it over shaker screens. These are generally of two parts, either suspended or resting on rollers, and driven by eccentric shafts from a steam shaker engine. The dip of the screens is from 15° to 20°.

Coming from the mine the coal is dumped into the weigh basket from self-dumping cages, crossover dumps or from the common "tip over" dump, depending on whether the mine opening is a shaft or slope. It is then dumped

*526 East Seminole Ave., McAlester, Okla.

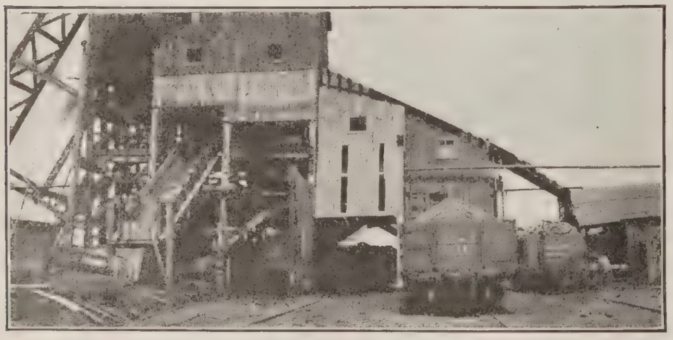

Fig. 2. Loading Arrangements, Mine No. 5, Osage Mining Co., Krebs, Okla.

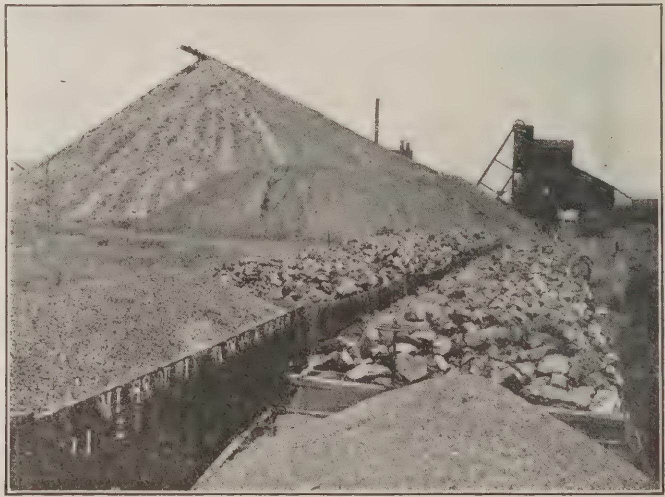

Fig. 3. Some of the Sized Coal from Mine No. 5 at Krebs, Okla.

onto the shaker screen. The sizes of holes and lengths are given in Fig. 6.

Through $\frac{5}{8}$-in. perforations, the product is slack coal; and over $\frac{5}{8}$-in. and through $1\frac{1}{4}$-in. perforations, the product is pea coal; over $1\frac{1}{4}$-in. and through $2\frac{1}{2}$-in. perforations, the product is nut coal; over $2\frac{1}{2}$-in. perforations, the product is lump coal.

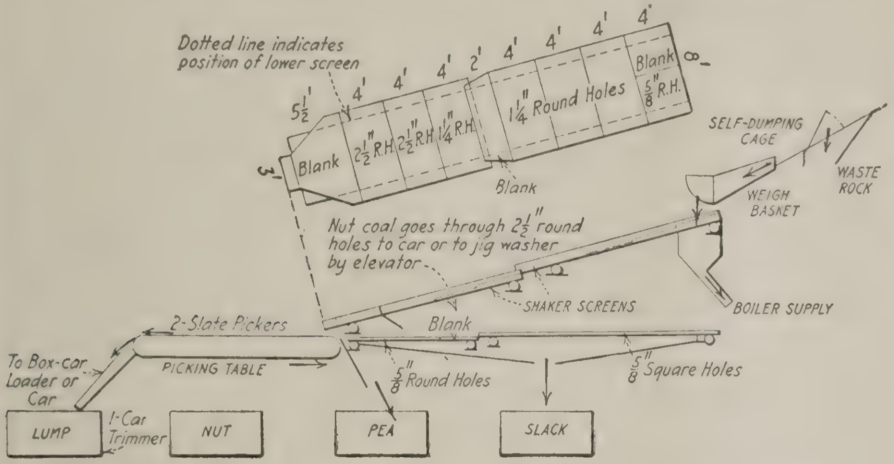

FIG. 4. SCREENING ARRANGEMENT AT MINE NO. 5, ROCK ISLAND COAL MINING CO.

Fig. 6 shows a general practice through the western end of the Oklahoma coal fields. In the eastern portions of the field the coal is generally treated as lump and as mixed nut, pea and slack, giving two sized products only. Where nut coal is separated the slack goes through $1\frac{1}{4}$-in. screens.

THREE GRADES OF COAL ARE MARKETED

In general there are three grades of coal put on the market: Domestic lump, the slack, pea and nut coal being taken out; commercial lump, the slack and pea being taken out; run-of-mine, all sizes being put into one car. (In some cases I believe there is a limit placed on the amount of allowable slack.)

One of the most uptodate screening plants in the McAlester district is at mine No. 5 of the Rock Island Coal Mining Co., at Alderson.

The shaker screen is divided into two parts, resting on rollers. The upper part consists of four plates about 8 ft. wide and 4 ft. long. The upper plate has one-half blank and one-half perforated with $\frac{5}{8}$-in. round holes for boiler supply. The next three plates have $1\frac{1}{4}$-in. round perforations. See Fig. 4. The second part of the shaker has three plates about 8x4 ft., of which the upper plate has $1\frac{1}{4}$-in. and the two lower plates $2\frac{1}{2}$-in. round perforations. From here the lump coal passes onto a horizontal picking table, where the slate and shale are picked out. The cleaned lump then goes to the car or the box-car loader.

The nut coal goes directly to the car if necessary, but usually it is sent by elevator to a jig washer. This brand of coal has proven popular.

The treatment of slack and pea is quite novel. All the pea and slack from the $1\frac{1}{4}$-in. plates on the shaker falls onto a nearly horizontal shaker of two parts. The first part has a $\frac{5}{8}$-in. square-hole screen about 24 ft. long. The second part has about 6 ft. of blank screen and 6 ft. of $\frac{5}{8}$-in. round-hole screen. The product through the screens is slack; over the screens pea coal of good grade is produced. There are several modern washeries throughout Oklahoma where slack, pea and nut coal are washed. The coal is sized as slack, pea and nut, and in general too much slack in pea or nut causes complaints from the consumer. At the present time only jig washers are in use in the McAlester district, and no attempt is being made to wash coal on a large scale.

Machines are becoming more popular in this field and are having a good effect on the sizes produced. At mine No. 5 of the Osage Coal & Mining Co., at Krebs, three average months of shooting from the solid in 1911-1912 gave these percentages of the various sizes produced: Lump, 53; nut, 12; pea, 5; slack 30. For machine mining in the same mine three average months in 1915 gave these percentages: Lump, 52; nut, 14; pea, 10; slack, 24. More lump could be secured if the miners would use less permissible explosive. They seem to be much averse to breaking up the large lumps.

FIG. 5. A CAR OF STEAM LUMP COAL

The writer is indebted to W. A. Evans, general superintendent of the Rock Island Coal Mining Co., and to James Duncan, receiver for the Osage Coal & Mining Co., for permission to use the drawings and pictures shown.

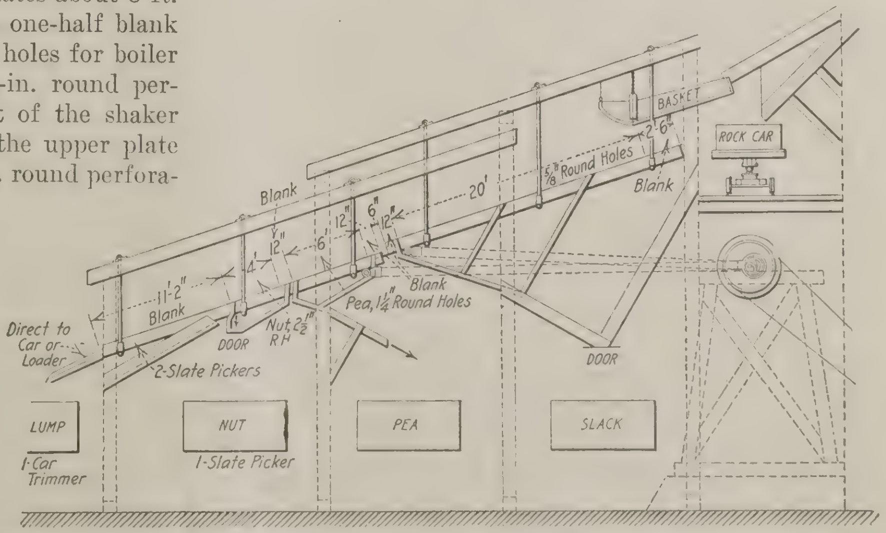

FIG. 6. USUAL ARRANGEMENT OF SCREENS AT THE LARGER OKLAHOMA PLANTS

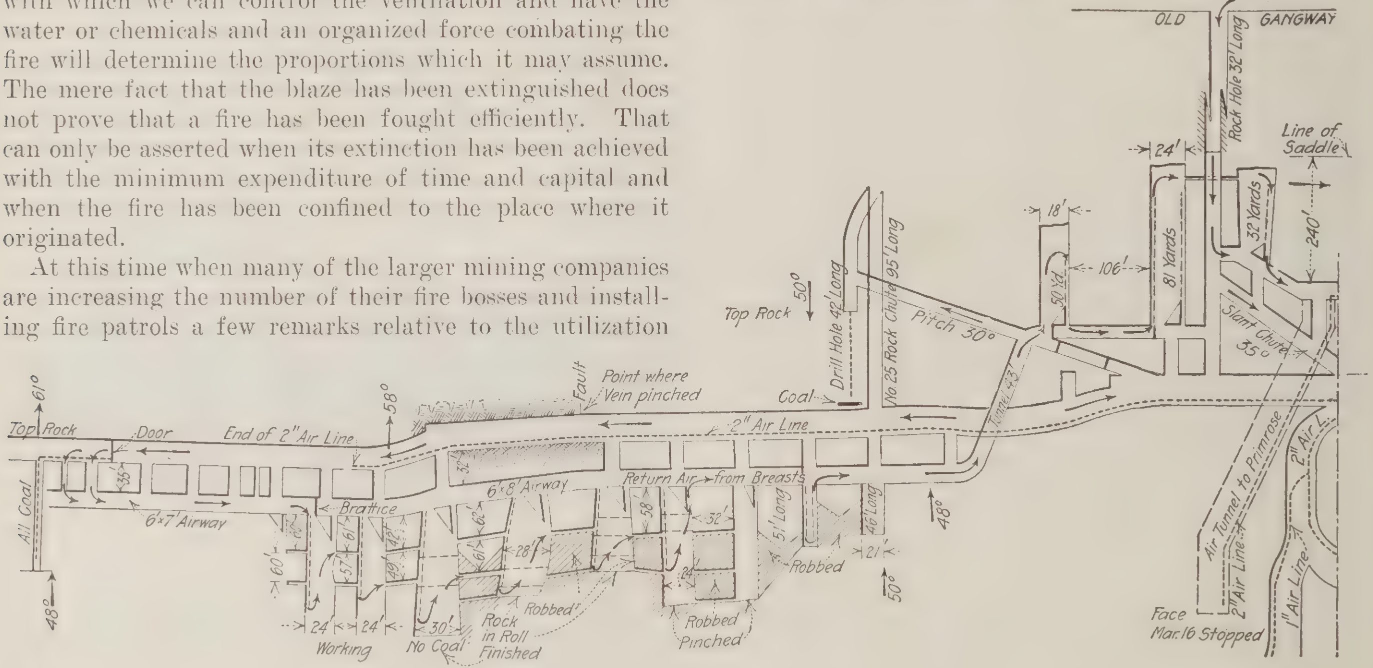
Forestalling Underground Fires at the Lansford Collieries*

By J. McCrystle†

SYNOPSIS—Maps are prepared by the Lehigh Coal & Navigation Co. which show diagrammatically the resources available in coping with fires and the dangers which must be faced. These drawings are not necessarily made to scale.

A mine fire is an ever-present hazard in coal mining, its time, location and cause being always uncertain. Constant vigilance must be maintained at all times, and the ability to fight it successfully will for the most part depend upon the degree of preparedness and upon the preliminary measures that have been taken. The promptness with which we can control the ventilation and have the water or chemicals and an organized force combating the fire will determine the proportions which it may assume. The mere fact that the blaze has been extinguished does not prove that a fire has been fought efficiently. That can only be asserted when its extinction has been achieved with the minimum expenditure of time and capital and when the fire has been confined to the place where it originated.

At this time when many of the larger mining companies are increasing the number of their fire bosses and installing fire patrols a few remarks relative to the utilization of local conditions and on the means of increasing the efficiency of the fighting force may be pertinent.



A Rough Diagrammatic Sketch of a Section of the Mines with Numerous Extensions and Annotations

Importance of First Steps

In the early stages following the discovery of fire, there is always a certain amount of excitement. When the foreman or superintendent arrives, it is imperative to organize the men in the vicinity at once and probably necessary to send for others. There may be a force already on the ground sufficiently large for the work to be accomplished, but the men not having been selected are probably not reliable or otherwise unsuited for fire fighting. The man in charge will first make it his duty to see that no workmen remain in places traveled by return air from the fire. He will have to regulate his ventilation, procure pipe or hose to carry the water, and decide where to make his hose connections. These and innumerable other details will have to be arranged immediately upon his arrival. In the majority of cases the foreman is the only one intimately conversant with the entire ventilating system, the only person who knows the location of the fire-fighting apparatus and water lines, and should he make a bad decision or become injured the fire may have an opportunity to extend beyond the point where fighting it by direct methods will be of avail. A few well-directed efforts in the incipient stages of the fire will be of more consequence than thousands spent later.

The "boss" is the natural leader of the emergency squad. If he is experienced he will appreciate that it is necessary to say "Come, boys" instead of "Go, boys." It will be his work to allay the fears of his squad and to imbue the men with confidence. His usual place is right on the firing line, and he is frequently one of the first to be overcome.

In three cases in my own knowledge the foreman has been scalded by the steam resulting from a too-zealous application of the water, thus leaving the fire squad without a leader.

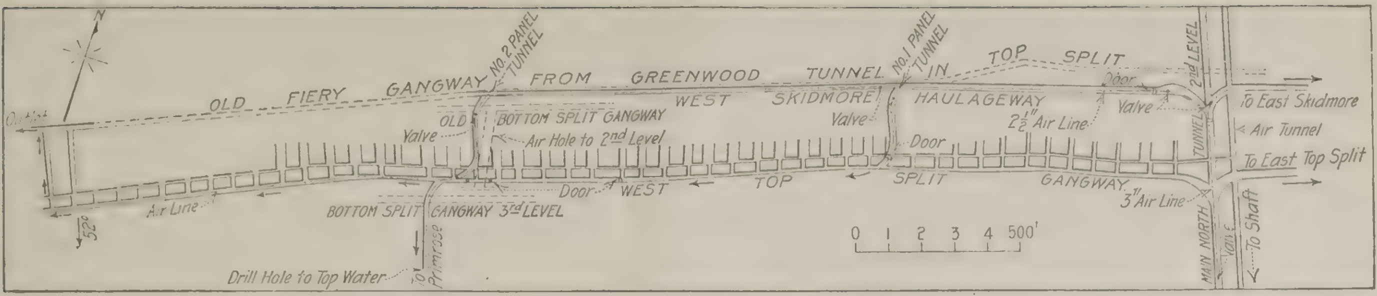
Formulated Rules for Fire Fighting

To eliminate delays, to insure that everyone will work in conjunction and will play his part, to have dependable men immediately available for combating the fire, to remove as many decisions as possible from the excitement of the moment, so that the right thing will be done the first time, the Lehigh Coal & Navigation Co. has anticipated the possibility of fires in the various underground workings of the western division and has organized a committee of the colliery officials to formulate rules for fighting them. In other words, it has assumed a fire to have

---

*Paper read at Tamaqua division meeting of the Panther Valley Mining Institute.

†Division engineer, Lehigh Coal & Navigation Co., Lansford, Penn.



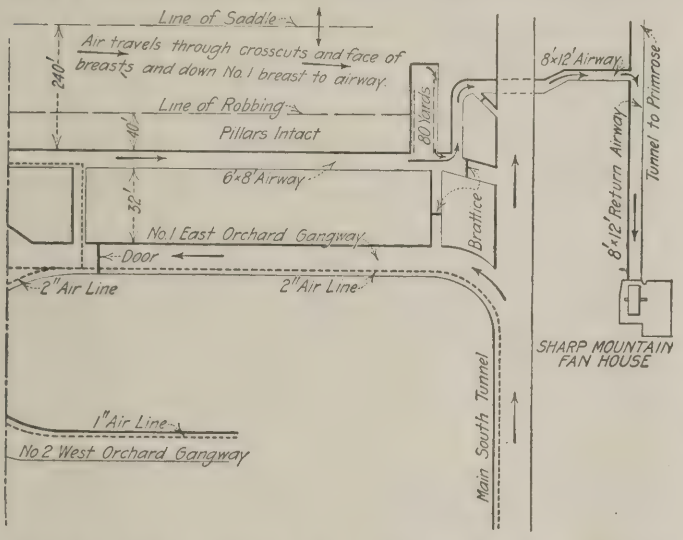
A Map Prepared to Exhibit the Fire-Fighting Possibilities in a Mine Level

started in possible places in each vein and has then adopted fire rules.

These regulations, however, do not embrace a policy for fighting a fire that has gained headway, but cover only the work from the time of the discovery of a fire until water is applied or the higher officials arrive. The preliminary work thus performed may be said to bear the same relation to a fire as "first aid" does to an injury.

Sketches Furnish a Visual Record of Situation

To facilitate and simplify this work, sketches have been made to scale of each of the several fireboss districts, showing the workings, the location of the doors and regulators, the air line and valve, the location of the fire apparatus and anything that would have any bearing on a possible fire. The sketches and instructions are of such size as to be readily carried in the pocket. Each fireboss has a set of his individual district, while complete sets are kept at each fireboss' "shanty" and at the foreman's, superintendent's and fire inspector's offices. The sketches are revised as often as necessary to conform with the changes in the ventilation, the erection of doors, the extension of air lines, etc.



Made by the Fireboss for Fire-Fighting Purposes

Further, each fireboss has a pitch plan drawn by himself of his own territory showing the length of the breasts and pitch, the headings, ribs, thickness of coal, condition of roof and manways, and any data that would have any bearing on either a probable fire or future mining. These are but picture sketches, and no attempt is made to have them to scale. The value of these picture plans when an effort is being made to cut off or get a heading above the fire can be readily realized.

A map of the entire colliery showing the complete air system, air lines, valves and water lines accompanies the foreman's, superintendent's and fire inspector's sketches. The sketches further allow the fireboss to follow the rules graphically; they enable the higher officials who probably are not familiar with the details of the workings to grasp the situation readily, and if anything should happen to either the foreman or fireboss the sketches would reproduce information that otherwise would undoubtedly be unobtainable.

All Air and Water Lines Are Connected

In most large anthracite mines, particularly those having any rock work in progress, compressed-air lines are found following many of the gangways. These may be used for fighting fires and may be rendered readily available beforehand by making connections between them and the water-line, these connections being controlled by valves. Should no pipe be laid in the gangway in question, it may be found more expedient to tear up the pipe in another gangway and relay rather than to wait for other pipes to be brought in from some other source.

When placing doors and brattices, their use in an emergency is now carefully considered. Formerly the ventilating needs were alone regarded as important. In all air lines laid recently, tees, unions and valves have been placed at short intervals, so that the line may be broken with minimum trouble and the hose connected as near the fire as possible.

The fire committee consists of the superintendent, foreman, fire inspector and engineer. Once-a-month meetings are held at which the firebosses, etc., are questioned regarding rules. Afterwards any alterations made in the air lines or ventilation during the previous month are noted, and any suggested changes or additions to the existing rules are discussed. It will be noted that firebosses, etc., are required to memorize the rules, just as railroad employees are instructed to commit to memory the regulations prepared by the transportation companies for which they work. No reference to the instructions should be necessary during an emergency.

In preparing the fire rules a separate study has been made of each gangway or section. The first steps to be taken are then discussed and finally embodied into a set of rules to govern each condition.

In this way the responsibility is to a large extent removed from the shoulders of the foreman and a deliberate policy is substituted for the snap judgment made under excitement. While everyone covered by the rules has his own individual part to perform, the whole force is coördinated so as to do team work.

The first rules for fire service refer to the removal from danger of any workmen likely to be affected and explain the most expedient way of getting them out in safety. Then follow rules for cutting off the air, allowing just enough to clear away the smoke, and in these clauses the various doors and regulators required are designated. Should the fire be discovered at night or while the fireboss is making his inspection in the morning, the foreman and fireboss must be informed. A good telephonic system is installed everywhere, connecting all parts of the collieries inside and out. Thus the man who discovers the fire can notify the engine house or fan house as soon as the ventilation has been regulated. There is always someone on duty at those places. He should be informed as to the extent and location of the fire. He in turn telephones to the foreman and superintendent, leaving the fire or nightboss to turn his attention wholly to the fire.

The valves are then adjusted so as to carry water to the site of the fire, the compressed air being shut off and the water turned on. Long before a fire occurs the foreman has prepared a list with the addresess of men on whom he can depend and on whom he will probably have to call for assistance. A subordinate to whom the list has been intrusted can readily summon these men on demand.

Recently the company has added to the book of fire rules data and tables which may prove valuable to the possessor in the performance of his various duties. He is required to familiarize himself with these and to become proficient in their use.

Since rules and monthly meetings have been introduced interest has been reawakened in subjects that usually are forgotten as soon as the certificate as mine foreman is granted; the precautions for the prevention of fire are being more closely observed, and there is apparent a general improvement in the work and morale of all concerned.

Extracts from a Superintendent's Diary

Again and again I am reminded of the fact that a man's point of view is largely governed by his experience. Today, for example, I made my final decision upon the purchase of a new ventilating fan for our No. 3 mine, and in choosing the fan, to meet the requirements as I saw them, I had to disregard the recommendations of our electrical engineer as well as our master mechanic.

They preferred a small high-speed fan of high efficiency and low cost, direct-connected to a motor with a rating slightly in excess of our maximum requirements. Their experience with alternating-current motors had taught them that motors of that type give highest efficiency when operating close to their rated capacity, and being engineers, primarily, efficiency and cost received first consideration with them.

My experience had taught me that there are times when it is very necessary to speed fans up far beyond their regular capacity, and if one has a large fan running below its rating that is a simple matter; but if one has a fan and motor working on regular duty to maximum capacity a sudden unexpected demand furnishes a serious problem. After a discussion, in which I gave them the benefit of my information, they came to agree with me and withdrew their recommendations.

There was a time when I considered it beneath my dignity to act on suggestions volunteered by my subordinates, but in looking back I realize now that they were well qualified to offer me suggestions then, as my experience up to that time had not given me a vision much broader than their own. Now, however, the question of dignity would not hold me back for a moment, but as a matter of fact I seldom receive suggestions from my employees that are worthy of much consideration because with my broader vision I see so many obstacles that have never occurred to them.

In this connection I am always reminded of a little story one of my mine foremen tells about one of his drivers, a little colored boy.

Sam was given a mule to drive with a run extending the entire length of a cross-heading, and he had to deliver his cars to a side track, from which the loads were handled by electric locomotives. In giving him his instructions, the boss driver failed to warn Sam about the danger of entering the side track with loads when the switch light showed red to indicate that the current was on.

On his first trip, when Sam arrived at the side track with his loads, his mule seeing the red light refused to pull the cars into the siding. Sam could not understand.

He got down from the cars and began to remonstrate with the mule something after this manner: "Say there, yo' fool mule, what yo' stallin' 'bout? Yo' bettah go long now an' tend to business for I'se seized wid a peevish feelin'; yo' can't temporize wid me, dat yo' can't."

Still the mule stood still, so Sam got busy with his lash. The mule remained as stubborn as before. Then the locomotive passed along the main entry and the red light turned white. Immediately the mule started off and pulled into the siding. Sam deliberated over the performance for a few moments, and the mystery cleared. Then he reached up and patted the mule on the head.

"Say, ole mule, 'pears lak de wrong thinking machine wus put in charge of dis yere outfit," was the way he worded his apology to the mule. Pretty good illustration of what sometimes happens when brains attempt to dictate to experience.

Personnel of the West Virginia Coal Association

The names of the executive committee of the West Virginia Coal Association are as follows, the committeemen and alternates being given in their respective order:

Fairmont district, C. H. Jenkins, R. B. Isner; New River district, G. H. Caperton, S. A. Scott; Pocahontas district, W. D. Ord, L. E. Tierney; Tug River district, George Wolfe, A. B. Rawn; Thacker district, T. E. Houston, F. L. Schoew; Guyan district, A. R. Bisel, J. J. Ross; Kanawha district, J. W. Dawson, E. O. Dana; Wheeling district, J. C. McKinley (no alternate); Chesapeake & Ohio Shippers' Association, William Puckett, Quin Morton; Independent Operators, J. G. Bradley, George Wolfe.

The officers of the committee are as follows:

J. W. Dawson, chairman, Charleston, W. Va.; C. H. Jenkins, vice-chairman, Fairmont, W. Va.; A. H. Land, treasurer, Barbourville, W. Va.; W. H. Cunningham, secretary, Huntington, W. Va.

The general offices of the company are in the Robson-Prichard Building, Huntington, W. Va.

⁂

Life Tenant's Right to Dispose of Coal.—One who merely owns a life interest in land has no right to sell coal underlying the tract, although he may take reasonable use of the same for domestic purposes. (Kentucky Court of Appeals, McCoy vs. Ferguson, 175 Southwestern Reporter 23.)

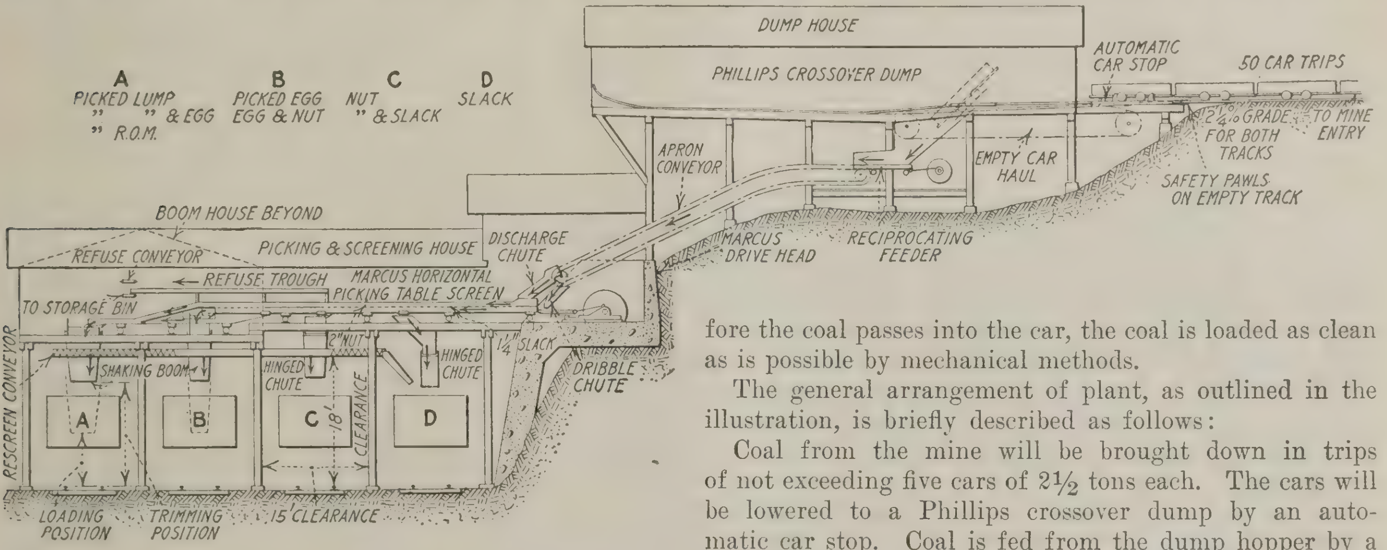
An Eastern Preparation Plant

By W. R. Ourand*

SYNOPSIS—A West Virginia plant in which has been embodied apparatus for a fuel preparation which is decidedly in advance of present market requirements.

The Harty Coal Co. was recently organized to develop coal properties on the Virginian Ry. in Wyoming County, just east of Mullens, W. Va. This coal lies in the northeastern corner of the Pocahontas field on the headwaters of the Guyandotte River.

The coal produced on the Virginian Ry. comes principally from the Winding Gulf Branch in the New River field or from points farther west and is hauled eastward through Clark's Gap in the Flat Top Mountains to points along the Atlantic seaboard. Shipments from the great loading plants at Sewall Point and at other seaboard piers and local railroad consumption constitute the immediate field for disposal of these coals.



General Arrangement of Tipple and Preparation Plant

For this reason coal at the mine is loaded into railroad cars for shipment with little or no effort to produce either a high percentage of lump or sized coal or to pick out slate or other foreign matter. It is probable that efforts to prepare a more uniform fuel will not be extensive in this section until other outlets are secured. An improved preparation of coal for shipment will then be required similar to that now being made at the mines in other West Virginia fields supplying the domestic trade in neighboring states.

However, in anticipation of new markets and in advance of similar means of preparation in this locality, the Harty Coal Co. has equipped its new operation with the most modern picking and screening machinery, and is prepared to produce four sizes of coal—picked lump, picked 4-in. egg, and picked 2-in. nut and 1¼-in. slack—together with picked run-of-mine or any other usual combination of sizes.

On account of the somewhat soft and friable nature of the coal, less strenuous methods of mining are to be attempted, so that the larger sizes of coal will be produced in a greater percentage than at present. The tipple equipment is designed with the idea of reducing breakage to the minimum and permitting the full percentage of larger sizes produced to be loaded into cars.

To this end the new type of shaking loader boom is installed for the lump and egg coals. In addition to providing an easy descent and perfect trimming of the car, this boom assures an extra-high-class product by its ability to rescreen any fine coal made in the preparation of the larger sizes. As this rescreening is done just before the coal passes into the car, the coal is loaded as clean as is possible by mechanical methods.

The general arrangement of plant, as outlined in the illustration, is briefly described as follows:

Coal from the mine will be brought down in trips of not exceeding five cars of 2½ tons each. The cars will be lowered to a Phillips crossover dump by an automatic car stop. Coal is fed from the dump hopper by a reciprocating feeder delivering to an apron conveyor, which lowers it to the horizontal picking table screen, on which it is picked and separated into the desired sizes. The refuse removed is discharged into a conveyor without need of rehandling and is deposited in a storage bin.

The Mine-Car Storage Yard

The mine-car storage yard leading from the mine entry is arranged with both loaded and empty tracks on a common grade sloping at 2¼ per cent. toward the dump. This necessitates an empty car haul capable of pushing 50-car trips up this grade. Provision is also made with safety pawls for holding this trip on this adverse grade until it is picked up and hauled back into the mine by the locomotive.

The tipple structure over the railroad tracks is arranged for rather unusual conditions because of the requirements of the railroad. A minimum clearance of 18 ft. above the top of rail and a lateral clearance on each track of 15 ft. are given for the permanent structure in addition to arranging all equipment so that it may be raised entirely out of these minimum clearances.

This arrangement permits the Virginian Ry., which has only a single track at this point, to utilize all tipple yard tracks when necessity demands. The plant was designed and the equipment supplied by the Roberts & Schaefer Co., of Chicago, the installation being directed by J. C. Sullivan, manager of the Harty Coal Co.

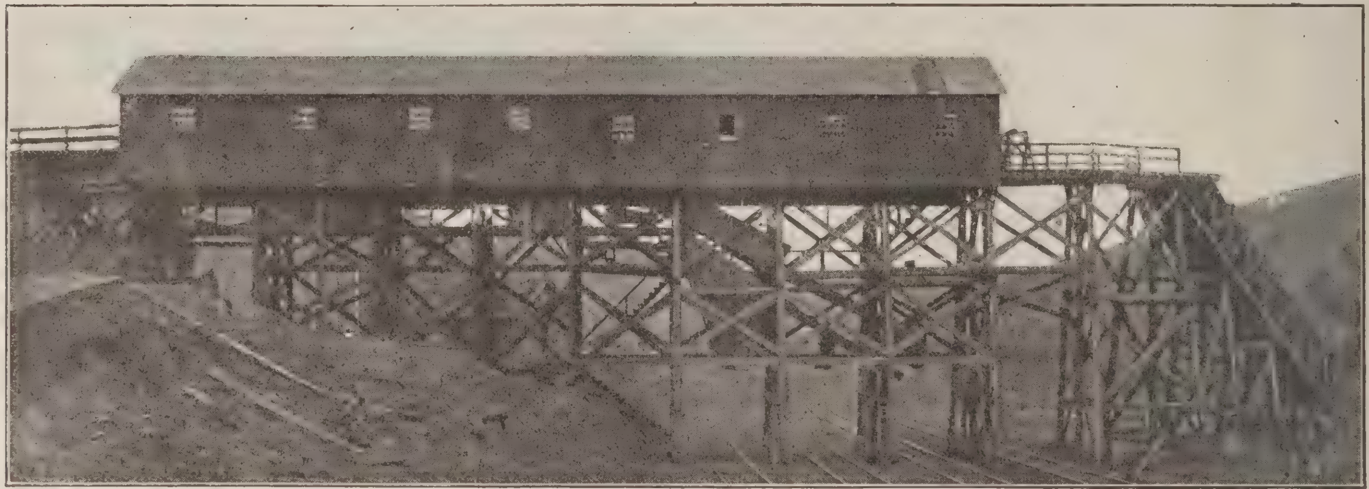
Efficient Tipple Arrangement

By R. G. Read*

SYNOPSIS—Details of an installation designed to thoroughly screen a large tonnage at a very small labor and maintenance cost with a minimum initial investment.

The operations of the Maryland Coal Co. of West Virginia are located at Wendel on a branch of the Baltimore & Ohio R.R. leaving the Parkersburg division at Simpson. The tipple at No. 1 mine is of the usual gravity screen type where the coal is dumped directly into a chute leading to the screens. Owing to the fact that the impurities exist in this coal largely in the slack or very fine sizes it was found necessary to resort to some more efficient means of screening, and in the No. 2 tipple this fact was recognized and given special consideration. As the coal from this mine is used largely in the lake trade, no special sizing of the coal is required, and the use of shaking screens was not considered necessary, although it was at first thought that the final separation between nut and slack would have to be made in this manner.



Maryland Coal Company's Tipple, Simpson, W. Va

The equipment as it was installed is shown in the accompanying illustration. The coal is brought in 50-car trips to the tipple, the locomotive is then run around and the trip backed onto the car-haul or rather coupled to the three cars which are left standing over the car-haul. This method of operation obviates the necessity of using any form of knock-over or spring-dog or spur on the car-haul. The car-haul feeds the cars to the dump at a uniform rate of five cars per minute, each car being pushed over a slight knuckle which allows it to settle back so as to allow the coupling pin to be easily removed, after which the forward movement of the trip pushes the car over the knuckle, from which point it runs by gravity over the scales and into the Phillips crossover dump. An automatic device opens the door as the car is being dumped. (For description of this device see article by Elkins Read, Coal Age, p. 434, Mar. 14, 1914.) The scales are equipped with a printing beam which automatically records the weight of each car, so that the dumping and weighing of the coal are done practically without labor.

The coal is dumped into a hopper having a capacity of two cars, from which it is fed by means of a motor-driven reciprocating feeder. This is provided with adjustable crank disks so as to vary the rate of feed by changing the stroke. The coal passes from the feeder plate to the dead plate of the screen.

Screening Equipment

The screening equipment consists of two gravity bar screens. The upper screen is 8 ft. wide and 16 ft. long, made in sections with 4-in. drop to turn the coal over. The bars are spaced for 1½ in. clear opening and are of the Akron type. Veil plates in sections are provided for making run-of-mine coal. The lower screen is 8 ft. 6 in. wide, and 16 ft. long and the bars are spaced for ¾ in. clear opening.

The lump coal is loaded by means of a spiral pipe chute with necessary counterweighted apron extensions for loading high and low cars. The chutes are so arranged that the nut coal can be loaded separately or with the lump to make ¾-in. lump coal, or it may be loaded with the slack. The slack is loaded through a hopper with drop-bottom gate, which acts also as a trimming plate.

The car-haul in connection with the feeder makes it possible to handle a very large tonnage with a small hopper. This reduces breakage. The coal being delivered to the screens at a uniform velocity never attains the high speed which is so objectionable in an equipment where the coal is dumped directly onto the screens, and consequently the breakage is materially reduced. A careful investigation has proven that no appreciable breakage results from dumping the coal into the small hopper.

The results accomplished by this equipment justify the belief that a similar outfit can be used to advantage in a great number of places where the conditions call for a thorough screening of a large tonnage at a very small labor and maintenance cost with a minimum initial investment.

The Electric Mine Locomotive and Its Motor Equipment

By R. R. Dunlop*

SYNOPSIS—Tables are here presented that show the drawbar pull and haulage capacity of various weights of locomotives on level track and on grades up to 10 per cent. when equipped with either cast or steel-tired wheels. These figures are sufficiently accurate for all commercial purposes.

Numerous articles have been written regarding the procedure of selecting the proper weight of locomotive for a given haul, but most of the methods offered are complicated and involve the use of formulas and characteristic curves. These may be appreciated by a few engineers, but not by the average mine manager or foreman, whose time is usually occupied and for whose use data must be brief and to the point.

For the purpose of providing a simple and practical method of selecting the proper weight locomotive for a given duty, I offer Tables A and B, which show the haulage capacity of mine locomotives when equipped with chilled-tread cast-iron wheels and steel-tired wheels.

TABLE A. HAULAGE CAPACITY OF ELECTRIC MINE LOCOMOTIVES EQUIPPED WITH CAST CHILLED WHEELS

This table gives the drawbar pull in pounds and the haulage capacity in tons for a given weight of locomotive on various grades, when equipped with chilled cast-iron wheels. A co-efficient of friction of 30 lb. per ton has been assumed on level track, and 20 lb. per ton for each per cent. of grade.

25	12500	416	12000	240	11500	164	11000	122	10500	96	10000	77	9500	64	9000	53	8500	45	8000	38	7500	32
30	15000	500	14400	287	13800	197	13200	146	12000	114	12000	92	11400	76	10800	63	10200	53	9600	46	9000	39

The drawbar pull of the locomotives listed in Table A is arrived at as follows:

A locomotive equipped with cast-iron wheels will, on a level track, develop 400 lb. per ton drawbar pull before the wheels slip. The drawbar pull of a locomotive equipped with cast-iron wheels will decrease 5 per cent. for each per cent. of grade, as this per cent. of drawbar pull is necessary for hauling the locomotive itself up the grade.

Referring to Table A, it will be noted that a 10-ton locomotive will develop 4000 lb. drawbar pull on a level track and will only develop 75 per cent. of this drawbar pull on a 5-per cent. grade, or, in other words, the drawbar pull is decreased 25 per cent., or 5 per cent. for each per cent. of grade.

It will be noted also that the haulage capacity of all locomotives shown in Table A and Table B is determined by assuming a resistance of 30 lb. per ton of load for level track and 20 lb. per ton additional for each per cent. of grade.

Referring to Table A a 10-ton locomotive will haul 133 tons on level track and on a 5-per cent. grade it will haul 23 tons. In other words, 4000 lb. is divided by 30 on a level track and 3000 lb. is divided by 130 on a 5-per cent. grade.

Referring to Table B a 10-ton locomotive will develop 5000 lb. drawbar pull on a level track and on a 5-per cent. grade it will only develop 80 per cent. of this drawbar pull, or 4000 lb. On a level track 167 tons can be hauled, which equals 5000 divided by 30, and on a 5-per cent. grade 31 tons can be hauled, which is equal to 4000 divided by 130.

The use of these tables will permit of the selecting of the proper weight of locomotive for a given train load on various grades with sufficient accuracy for all practical purposes.

---

*Jeffrey Mfg. Co., Columbus, Ohio.

Where a grade is to be negotiated in a given haul and the locomotive, with its train, is under headway before reaching the grade, larger train loads can be hauled than shown by the figures given in the tables. Where the grade is of any considerable length or where the train is to be started on a grade, the figures in the tables should be used as a basis in selecting the proper weight of locomotive.

In Regard to Motor Equipment

A locomotive should be equipped with motor capacity sufficient for developing the rated drawbar pull without reaching normal full load on the motors. By a normal full load is meant the one-hour rating, temperature rise not to exceed 75 degrees.

Calculated motor capacity for a given duty may indicate the capacity for that particular duty, but suppose the duty for that particular locomotive should be increased within the limits of drawbar pull for such a machine, what then? Is it not more practical for a manufacturer to determine from installations of various motor equipments which size to use on a given weight of locomotive? The reputation of the manufacturer is made or lost by the record of performance of his product.

The determining of the proper sized motor equipment for a given weight of locomotive is not a complex problem or one which the manufacturer is required to split hairs over unless he is inclined to give as little for the money received as possible and run the risk, sometimes, of giving too little.

There are thousands of locomotives in use in this country, and a study of these equipments will show that locomotives supplied with motors having a capacity of 10 hp. per ton and geared to drive the locomotives at six miles per hour are first-class equipments and amply large for any weight of machine. Such equipments will take care of practically any duty within the capacity of the given weight locomotive.

When the speed of the locomotive must be more than six miles per hour, the horsepower per ton rating of the motors should be increased not less than in direct proportion to the increase in speed.

All first-class manufacturers have motor equipments embodying high continuous capacity, and if sufficiently large motors are used for a given weight of locomotive, as outlined above, they will not overheat.

If the motors are too small, ventilation from the outside does little to increase their capacity because the motors are totally inclosed, the motor frames being the only surfaces exposed for radiation.

In any design of locomotive frame there is sufficient ventilation for carrying away the heat that is being dissipated by the outside of the motor frames, rheostats and other parts.

⁂

High Coal Prices in Spain

The shortage of coal continues, says a cablegram from the American consul at Seville appearing in *Commerce Reports,* owing to prohibition of exportation from England. The Seville Chamber of Commerce, fearing paralyzation of industries, has requested the government to endeavor to arrange with the British government for lifting the embargo. Prices at Cadiz are $14.50 to $16 per ton for Welsh steaming coal. Certain Spanish steamship lines are increasing freights on account of shortage.

What Operators Think of Ball Bearings

By Arthur V. Farr*

In January of this year the SKF Ball Bearing Co. attempted to ascertain what was the opinion of the coal-mining industry in regard to the use of ball bearings on locomotives. The company conducted a *questionnaire,* mailing approximately 800 letters to the engineers of representative companies, asking six questions about ball-bearing motors.

Forty-three answers were received. The majority of the officials addressed were not able to answer the questions definitely, others made guesses, while some few were able to give the facts with a reasonable degree of accuracy. Practically all the operators who attempted to answer gave opinions which pointed in the same direction, as will be seen from the following.

There was evidence in the answers of a definite interest in these questions and the realization on the part of the mine operators that such definite knowledge would be useful to them in determining the value of ball bearings on their equipments.

The answers indicate that a considerable number of mines have recently put in ball-bearing mine equipment and have not used it long enough to be able to get definite facts and figures. The questions and some of the more definite answers are as follows:

Questions No. 1—(a) What percentage of time are locomotives with plain-bearing armatures out of service owing to armatures striking pole pieces? (b) What proportion of these motors give trouble? Answers—(a) "20 per cent."; "30 per cent." (b) "We have no plain-bearing locomotives; don't want any machinery with plain bearings." "Our data are in favor of ball bearings; 50 per cent."

Ques. No. 2—How much is your total motor-repair bill affected by using ball bearings on the motor armatures? Ans.—"60 per cent." "We are sure there is a large saving." "50 per cent."

Ques. No. 3—What has your experience shown to be the increased life of the gears of motors equipped with ball-bearing armatures? Ans.—"From our experience with plain-bearing mine cars we know there is a large increase." "100 per cent."

Ques. No. 4—How much have motor failures owing to grounds on brush holders, cables and other parts inside of the motors been reduced on account of ball-bearing armatures? Ans.—"80 per cent." "75 per cent."

Ques. No. 5—What difference do you find in the average condition of commutators of plain- and ball-bearing armatures? Ans.—"Condition of commutator 50 per cent. better than plain." "Very good difference."

Ques. No. 6—(a) How much does it cost for lubricant per motor per year for plain-bearing motors? (b) For ball-bearing motors? Ans.—(a) "$8." (b) "$1.80 for ball-bearing motors."

Many of the companies, instead of answering the questions as given, made general statements such as the following:

"Since we have used ball bearings (for over a year) on our locomotives, there have been no armatures on pole pieces yet. Two cases of armature on pole pieces in same period of time on plain bearings."

---

*SKF Ball Bearing Co., New York City.

"We have no data from which to give exact information, but the four locomotives equipped with ball bearings give us practically no trouble, whereas the eight locomotives with plain bearings give us a lot of trouble and expense."

"In regard to ball bearings will say we find our commutators in better condition, and we have had no armature trouble with either of the two locomotives which we are operating and which are equipped with these bearings. We have three 8-ton locomotives so equipped."

"Our master electrician advises that he is a believer in ball bearings for motors, as he has experienced a great deal of trouble with the plain bearings. It requires a great amount of oil to keep them cool, and the oil soaks the winding and commutator and allows the armature to get down onto the pole pieces."

"So far, our experience with ball-bearing equipment has been satisfactory."

"We are operating practically all sizes and makes of mining locomotives. Our most recent purchases have been locomotives with ball-bearing motors. These have given excellent satisfaction."

It will be noted from these replies how general are the data of the mine operator in favor of ball bearings on locomotive motors. This feeling of the operators is well summarized in the terse reply of one man, who said, "All we can say is that we like the ball-bearing locomotives."

*

An Appreciation of Successful Management

BY AN EMPLOYEE

Just as streams are traced to their sources, so it seems is success or failure in managing industrial concerns nearly always attributed to the management. It takes the full measure of ability, energy and money to operate coal mines and industrial concerns so that the constant returns on the investment will spell success for the stockholders.

Those concerns, both large and small, whose management is broad enough in knowledge of humanity to adopt policies which involve a possible decrease of returns on investment in order to improve the physical, moral and financial conditions of their employees certainly deserve especial credit where this is achieved not only without the criticism but with the full commendation of the stockholders. I think this is particularly true when success of this kind is achieved in a district where broad policies of welfare work have hitherto been virtually unknown.

I think it is a fine thing to work for a company which is continually demonstrating (in good times and bad) that the well-being and best interests of its employees are one of the cardinal principles of its management. It is better yet to see indisputable evidences of the fact that such policies have proven successful; the strongest of these evidences is that public opinion in the district now concedes that the company pursues these policies, not to make money, but because they are right in principle. When public opinion ceases to attribute ulterior motives to a company spending money to improve the conditions of workmen, that company's policies are successfully demonstrated.

BIG CONCERNS ARE NOT AGAINST THE INTERESTS OF LABOR

The company I work for is one of the largest industrial concerns in the South. It operates coal mines and coke ovens and manufactures iron and steel. I must grant it is a big concern—but that does not mean that big companies are the only ones that can do this kind of work, for many smaller ones in the district are following its example. It is unfortunate that our present administration at Washington seems to have the idea that because a business is big it is bad. We have done all we can to show them otherwise so far as our company is concerned. We know that the benefits we enjoy now are due to the present administrative policies of our officials, and we would much regret to go back to former conditions.

In the old days a change in management for our concern simply meant changes in high officials and certain lower ones. To the rank and file it meant nothing more than getting used to new bosses as the result of changes higher up. But when our present administration took hold several years ago, a different atmosphere soon made itself felt. In the few years intervening, the application of new and broader policies has brought to us many desirable things.

WHAT HAS BEEN ACHIEVED

First, safety in the performance of our work. Everywhere "safety first" is recognized and consistently taught. The company provides every safeguard possible, and the men learned long ago that it pays them far more than it does the company to observe safety rules. Accidents of all kinds, especially those which are fatal, have been materially decreased, and for men who are hurt there is a plan of relief.

Second, improved working conditions. Working conditions everywhere have not only been rendered as safe as possible, but everything for the convenience and physical well-being of workmen has been provided, such as pure drinking water (iced in summer), bathhouses, lavatories and toilet facilities. All this is absolutely free to us.

Third, improved living conditions. Most of us live in company houses in towns near the works. These are now screened and fenced. Nearly all of us have gardens, and there are prizes for the best. There are streets and sidewalks, and we have a complete sanitation system, including fly-proof closets. Our drinking water is analyzed frequently to determine its purity; pools and ponds are either drained or oiled; in fact, everything possible is done to take care of the health and well-being of the residents of company towns. As a result sickness has been materially minimized, especially such sickness as is usually caused by the presence of flies and mosquitoes.

Fourth, improved community life. Our state ranks somewhat low in school facilities, but our management has provided excellent school buildings wherever they have been needed, with full equipment and first-class teachers. Special kindergarten facilities are provided for the children. If our wives and daughters want to learn more about cooking and housekeeping, that information is furnished too. There are playgrounds for the children. Churches have been provided also, and the company assists in helping us to keep the church buildings in good condition. A complete health department is maintained, including hospitals and home treatment, cheaper than any of us could secure the same class of service outside.

Fifth, right treatment of employees. It is the fixed policy of our management that the men must be treated right. The "big stick" policy is not countenanced anywhere. We have learned to know that the company has our best interests at heart. Courteous and fair treatment is the invariable rule. As is natural in the South the negro forms the largest single nationality among our workmen. In the past the negro worker in the South has been too much abused because of a certain natural ignorance and shiftlessness inherent in the race. Our company not only refused to take advantage of its labor in this way, but has done all it can to teach this class in particular the value of a dollar and the advantage of saving it. The company stores are operated, not to make money, but to be of help to the workmen. The drawing of store checks on earnings is discouraged as much as possible and is becoming less frequent all the time. The discounting of checks for cash is prohibited, and our company refuses to be a party to the plan still followed by many coal-mining corporations of issuing store checks and then buying them for cash at a discount.

The Outcome of Liberal Policies

The result of such policies is that hundreds of us are buying and becoming owners of our own homes, and this is one of the best evidences of contented workmen. Wages are good—in fact, higher than ever before in our district. Strikes have become unknown to us. In the old days a strike was a contingency to be expected every year. Now with the spirit of full coöperation prevailing we do not think about such things. There is a profit-sharing system and a pension plan for aged employees.

Summing it up and speaking for myself, I know that I am working for the best concern in our district. Everybody, public and all, concedes that. There is an atmosphere of loyalty all along the line. The outside public feels the same way and recognizes in our company the greatest developer and benefactor of the district.

I know that I am truthfully voicing the sentiment of the great majority of all classes of workmen for our company when I say that this means successful management. It is the kind of management that many concerns in our own district are emulating to the best of their ability, and it is the kind that it will pay every coal-mining concern desiring ultimate success to consider well. In short it is a magnificent dividend producer, for what better dividends can be desired than the knowledge that both men and company understand each other and are working together for a common success.

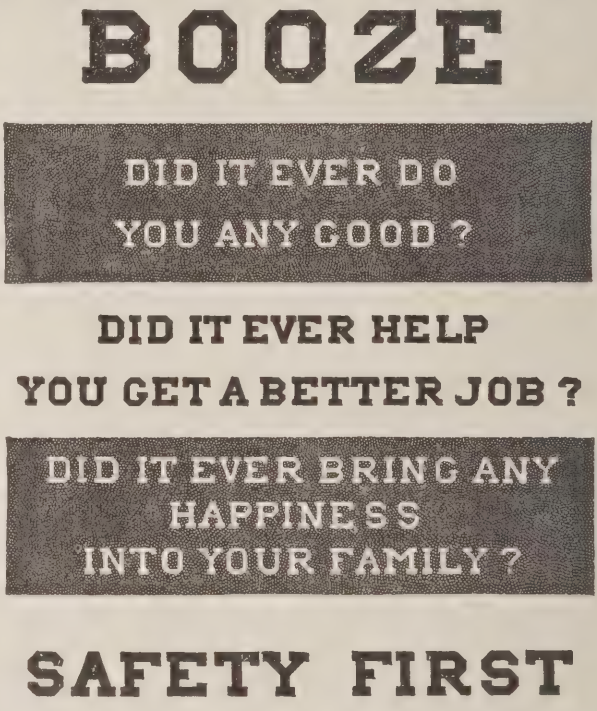
American Coal in Sweden

It was not profitable to import coal from the United States into Sweden during the past autumn and winter, says Consul Emil Sauer, of Goteborg, in *Commerce Reports,* on account of the high freight rates and the fact that exports from England to Sweden were resumed. At present, however, the freight rates from England to Goteborg are more than double what they were during the winter, and rates from the United States to Goteborg have decreased, so that they are little, if any, higher than the rates from England. On account of this fact and the partial export prohibition on English coal, it should be profitable now to ship American coal to Sweden on a large scale. Several Goteborg importers are already communicating with American coal exporters who applied to this consulate for assistance, and the city gas works of Goteborg has just ordered a cargo from the United States. Some German coal has come to Sweden during the last few months, and it appears now to be the German rather than the English competition that Americans have to meet.

(The facilities for and cost of discharging coal at Goteborg and a list of importers were given in Special Consular Reports No. 69, "Foreign Markets for Coal," which may be obtained, at 5 cents per copy, from the Superintendent of Documents, Washington. A supplementary report from Goteborg was published in *Commerce Reports* for Apr. 6, 1915.)

Coal Mining and Booze

The accompanying sign is displayed at the office of the Owl Creek Coal Co., Gebo, Wyo., right opposite the place where the miners receive their pay. It is about 18x30 in. and is made of a high-grade enamel with alternate stripes of dark blue and red.



BOOZE

DID IT EVER DO
YOU ANY GOOD?

DID IT EVER HELP
YOU GET A BETTER JOB?

DID IT EVER BRING ANY
HAPPINESS
INTO YOUR FAMILY?

SAFETY FIRST

An Opinion on the Export Outlook

Hugh L. Kirby, manager of the coal department of the Vernon Metal & Produce Co., is of the opinion that American fuels will soon displace a large tonnage of English coals now being exported to South America. Mr. Kirby has devoted considerable time during the past few years to a study of the export situation, paying attention particularly to New River coal. He has also under way a consolidation of several West Virginia mines.

In his opinion the soft-coal owners should avail themselves of the present conditions brought about by the European war and the embargo on Welsh coal, and inaugurate an aggressive policy. If the export business is developed he believes the problem of overproduction will be largely overcome. He states that American coal can be sold in Rio and Argentine at least $3 cheaper than English coal. The only obstacle in the way is the lack of bottoms and the fact that it costs 60 per cent. more to operate vessels flying the American flag.

A Coal-Traffic Readjustment

An important trackage agreement has been concluded between the Baltimore & Ohio R.R. and the Western Maryland Ry., whereby the latter will have access, with comparatively little construction, to two coal fields off its present lines and will participate in the traffic from a third. This agreement is a sequel to the purchase by John D. Rockefeller of a controlling interest in the Consolidation Coal Co. He already owned control of the Western Maryland Ry.

In the Somerset region of Pennsylvania, the Western Maryland Ry. will construct a short stretch of line extending from a point in Somerset County to a point in Westmoreland County, touching properties of the Consolidation Coal Co. on which new mines are to be opened. To reach this new track the Western Maryland, under the agreement referred to, will use about twenty miles of Baltimore & Ohio R.R. track.

In the Fairmont region of West Virginia, the Western Maryland Ry. will further construct a small mileage of track, in the nature of a mine branch, to serve intended new workings of the Consolidation Coal Co. To reach this the Western Maryland Ry. will use Baltimore & Ohio R.R. tracks for about seventy miles, from its own western terminus at Connellsville, Penn., to Fairmont, W. Va.

In the Cumberland region of Maryland, the Consolidation Coal Co. owns the Cumberland & Pennsylvania R.R., 57 miles long, which brings out approximately 1,500,000 tons of coal annually. This coal has heretofore been turned over to the Baltimore & Ohio R.R., but with the acquisition of an important interest in the coal company by the owner of the Western Maryland Ry., the latter found itself in a position to demand and obtain a division of this traffic.

Baltimore & Ohio Loses Traffic, But Gains Rental

These are the three sources of coal traffic affected by the agreement. In respect only to the last mentioned it is believed that the tonnage of the Baltimore & Ohio R.R. will be materially reduced. The extent to which its revenues will be affected has been authoritatively estimated at $700,000 or $800,000 annually.

The advantage to the Western Maryland, in addition to a share in the tonnage of the Cumberland & Pennsylvania R.R., will be found in its access to new coal fields and the opportunity to serve, exclusively, the new workings of the Consolidation Coal Co. It will be able to do this with a much smaller outlay of capital than would have been required if it had built its own lines through to the Somerset and Fairmont fields.

This agreement is regarded by railroad men as a striking illustration of the modern tendency to avoid duplication of railroad investment by making greater use of existing facilities wherever that is possible. While the Western Maryland Ry. will be saved an expenditure of possibly $8,000,000 to $10,000,000, the Baltimore & Ohio will benefit to the extent of the rental which under the terms of the agreement the Western Maryland Ry. will pay for the use of the tracks.

Of course, the Baltimore & Ohio R.R. will have to face new competition. By conceding the use of its tracks in this manner the railroad has opened the door to such competition, whereas 15 or 20 years ago it would doubtless have followed the custom of fighting the newcomer to the last ditch. The same competition as now would, in all probability, have resulted from such a course and a large expenditure on the part of the Western Maryland Ry. for about 100 miles of duplicate and largely unnecessary railroad would have been necessary. The Baltimore & Ohio R.R., also, would have missed the track rental it is to receive under the present arrangement.—*Boston News Bureau.*

Wilmington Meeting of the Penn. R. C. M. Assn.

By F. R. Wadleigh

The annual meeting of the Pennsylvania Retail Coal Merchants' Association held at Wilmington, Del., June 15 to 17, was an unqualified success, both in a business way and socially. The business sessions were ably presided over by President Howard White, of Philadelphia, to whose efforts and those of Secretary Wellington M. Bertolet was largely due the thorough, efficient and expeditious manner in which the various reports and discussions were handled.

The opinion seemed general that the association is doing the successful work for which it was formed, and at all the sessions there was a general feeling of fellowship.

The entertainment and social part of the meeting was most successfully provided for by the coal merchants of Wilmington aided by the Chamber of Commerce, while the lectures or talks of Chief Engineer Bevans, of the Philadelphia & Reading Coal & Iron Co., and Chief Mining Engineer Enzian of the U. S. Bureau of Mines were an excellent combination of entertainment and instruction that could not have been bettered. There were also a variety of interesting exhibits of the appliances and machinery used in the retail coal trade, which formed a valuable feature of the meeting.

The place of meeting, the "Play House" of the Du Pont Building, was ideal for the purpose, comfortable, well-ventilated and with ample room for everything and everybody. The association is to be congratulated on the convention as a whole, the large attendance, the spirit shown by the members, the efficient handling of all questions and the selection of Wilmington as a meeting place.

The convention was called to order by President White, and Mayor H. W. Howell, of Wilmington, welcomed the delegates in an unusually interesting speech, which was responded to by T. H. Tattersall, of Trenton, after which the delegates were again made welcome by President J. T. Satterthwait, of the Wilmington Chamber of Commerce.

Activities of the Association during the Past Year

President White, of the association, after taking the chair, delivered the annual address, which was followed by the reports of the various committees and officers. A *résumé* of the principal points covered in Secretary Wellington's reports follows:

The eleventh year of the association finds a membership of 1182—930 from Pennsylvania, 118 from New Jersey, 50 from Delaware and 84 from Maryland. During the year 272 new members were added. The total membership represents the sale of 3,000,000 tons of anthracite coal per year and includes 90 per cent. of the retail coal dealers of eastern Pennsylvania, New Jersey south of Trenton and Delaware and Maryland.

Consideration of the Clayton bill as affecting the coal trade showed that, as finally passed, the bill gives the coal operator the right to choose his own customers and that it may be used to prevent unfair competition. The proposed "war tax" on freight bills, finally dropped by Congress, was unjust and discriminatory and as such was formally objected to by the association. The Pennsylvania Anthracite Tax Act, now before the courts for determination as to its constitutionality, was touched upon, and dealers were advised to have a clear understanding with the operator or jobber from whom they bought coal as to the disposition of the tax in case the act was declared unconstitutional.

Attention was called to the percentage deductions on wet washed coal allowed by the carriers, as a result of complaint by the association. It was pointed out that this complaint has resulted in every member getting back a far greater return than the amount of his association dues. The order of the Public Service Commission of Pennsylvania reducing anthracite freight rates to Philadelphia territory about 40 per cent. is still before the courts, but it is not believed that the reduction will stand on the evidence as submitted. If the reduction is made, the rates to intermediate points will be reduced automatically by the terms of the long- and short-haul clause of the Public Service Act.

The past year has witnessed an unusual and widespread demoralization of prices. Retailers were able to purchase at unusually attractive figures, but many dealers did not take advantage of this fact and cut prices themselves, thus losing a profit they might have had.

The afternoon session consisted of short discussions on various retail trade topics, which were instructive, but brought out nothing particularly new. Reports of the several local associations were also read, giving information as to year's activities.

Concluding Sessions

The morning session on the second day was featured by the address on anthracite mining questions by Chief Engineer Bevans. Following this came reports of committees and the election of officers for the ensuing year. J. H. Tattersall, of Trenton, was elected president. The incumbents of the secretary and treasurer offices were reelected, together with five members of the board of directors.

The afternoon session was largely given over to a lecture on anthracite mining by Engineer Enzian, of the United States Bureau of Mines, the talk being illustrated by motion pictures taken especially for the bureau. These pictures showed every detail of getting out the coal—mining, preparation, loading and transporting, as well as first-aid work in case of accidents.

In the evening a smoker and vaudeville entertainment was given for the members by the City Club of Wilmington and was greatly enjoyed.

The following day was devoted by the members and their friends to a trip down the Delaware and back to Philadelphia, on the "Queen Anne," which was chartered for the occasion by Bush & Sons Co., the oldest firm of coal dealers in Wilmington.

The two lectures on mining should be of especial value; retail dealers, as a rule, are apt to take too little interest in and know too little about the mining end of the business. It would seem advisable to give them every opportunity to learn something about the way in which the product they handle is mined and prepared, and it is suggested that it would add to its value if the official organ of the association, *The Coal Dealers Message,* would include a mining department for the purpose of educating dealers on such an important and vital part of their business.

The exhibition of coal-handling machinery and supplies was quite elaborate and well worth attention. The facilities for exhibiting the various machines and their operation were ample, and the whole line of exhibits was the best yet seen at any of these meetings.

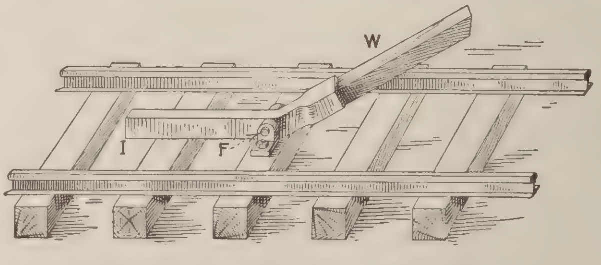
The list of exhibitors is as follows: Link-Belt Co., portable wagon loaders; Jeffrey Mfg. Co., portable wagon loaders; Autocar Co., motor trucks; Specialty Engineering Co., portable wagon loader, model of coal pocket; Gifford-Wood Co., portable wagon loaders, dealers' supplies; E. L. Koller, coal dealers' supplies; Standard Scale & Supply Co., oil engines, scales, supplies; Keystone Manufacturing Co., bags; F. S. Converse Co., screens, chutes and supplies; Howe Scale Co., scales; W. T. Lane & Co., bags; Fairbanks Scale Co., scales.

Safety Device in a Slope Mine

By Wilbur Greeley Burroughs

On the main slope of the Hisylvania Coal Co.'s mine, No. 22, at Glouster, Athens County, Ohio, the haulage is accomplished by means of an endless-rope system. The mine cars are gripped to the rope when coming out of and in going into the mine. If the rope should break, the loaded cars would run backward down the slope into the workings, with perhaps disastrous consequences. To insure against such an accident safety devices are installed at short intervals in the center of the track for the entire length of the slope.

One of these safety devices is shown in the accompanying illustration. Its operation is as follows: The arm *I* is made of iron, while the arm *W* is of wood. These arms are fulcrumed at *F,* this fulcrum being fastened securely to the track on the floor of the slope. The arm *W* is so attached that ordinarily it is high enough above the floor to be struck by the mine cars as they pass up the slope.



A Simple Car Stop for Mine Slope

As a loaded car moving up the slope strikes the arm *W,* it revolves on *F,* moving downward, allowing the car to pass over it, the iron arm *I* at the same time rising slightly into the air. When the car has passed over and the downward pressure on the arm *W* is thus relieved, the iron arm *I* on account of its weight falls to the floor of the slope, reëlevating *W* to its initial position.

If the rope to which the loaded cars are gripped should break, the rear of a loaded car going backward down the slope would come in contact with the arm *W* and be brought to a standstill. These devices are placed at short intervals so that a car cannot acquire much momentum before it is stopped by the arm *W*. Thus there is no danger of a car being thrown from the track by impact or of its gaining sufficient force to break the arm *W*.

⁂

Large Decrease in Output of French Coal

No statistics have been published that would indicate the actual production of coal in France in 1914, says Consul General A. M. Thackara in the supplement to *Commerce Reports,* but from information obtained from the Comité Central des Houilleres de France, the French coal mines worked up to their normal capacity during the first 7 months of the year. At the outbreak of hostilities the extraction of coal on account of the mobilization of the miners and the invasion by the enemy fell off to 60 per cent. of the average output. During the last four months of the year all the mines still in operation gradually increased their production, so that at the end of 1914 they were working to almost their full capacity.

The mines in the North Basin and two-thirds of those in the Department of Pas de Calais were either in the hands of the enemy or were in the center of hostilities, so that the production in these regions was almost nil. Taking these facts into consideration and estimating on the basis of the production in 1913, the output of coal in France during 1914 was about as follows: First 7 months, 23,500,000 tons; during August, 2,000,000 tons; during the last four months, 4,500,000 tons, making a total for 1914 of 30,000,000 tons.

Coal mines are now producing at the rate of about 20,000,000 tons a year or one-half the normal output. The annual consumption of coal in France for industrial, domestic and for other purposes averages about 60,000,000 tons. To supply the deficit of the native production about 20,000,000 tons of foreign coal in normal times have to be imported. While the railroads, electric light and gas plants are consuming nearly the same quantity of coal as in peace times, the almost complete cessation of operation in the great metallurgical centers of the north and east of France and the decreased activity in other coal-consuming industries have resulted in reducing the coal consumption of France to about 35,000,000 tons. Therefore it is estimated that from 15 to 16 million tons of foreign coal will have to be purchased.

As imports from Germany and Belgium are not possible, coal from Great Britain is being received in large quantities. The principal ports from which the coal is sent are in South Wales, although direct shipments are made from the east coast of England, notably from Hull, Newcastle and Hartlepool. The price of coal at the mines has either remained the same or increased but slightly, but the cost to the consumer has risen considerably owing to increased freight rates both on land and on water.

The receipts of coal from other countries in 1914 amounted to 15,344,550 metric tons against 18,710,935 tons in 1913, a decrease of 3,366,385 tons. Of the imports in 1914 Great Britain shipped 10,759,085 tons, Germany 2,341,996 tons and Belgium 2,032,098 tons. In addition to the above France imported 1,446,423 tons of coke in 1914 against 3,070,038 tons in 1913 and 746,875 tons of briquettes as compared with 1,085,994 tons during 1913.

Of the imports of coal during last year, 5,078,346 tons were received during the last six months, mostly from Great Britain. The exports of French coal during last year were 701,556 tons, compared with 1,304,377 tons for 1913, the principal country of destination being Belgium.

⁂

Coal Scarcity in Holland

The situation regarding coal in the Netherlands, says Consul F. W. Mahin, of Amsterdam, in *Commerce Reports,* is becoming precarious. Before the war unlimited quantities could be had from both Germany and Great Britain. Now the imports from those countries are small, uncertain and insufficient for current demands.

The wholesale price of coal in this market has doubled, bituminous coal having advanced from about $4 a ton, the normal price, to about $8; anthracite has increased to about $10.

While this country produces peat in great abundance, it produces practically no wood for fuel and so little coal as to be negligible—only about 1,500,000 tons a year, from a few mines in the province of Limburg. Therefore, if outside fuel supplies were entirely cut off, the Netherlands would be practically limited to peat for fuel.

As respects the coal supply for the near future, the outlook is uncertain. Attention has been turned to the United States, but distance and freight rates cause importers and users to hesitate about placing orders there.

In this country close economy is now being observed by users of coal. As an instance, the municipal street lights of Amsterdam are now burning at only one-half their usual strength, which with other economies materially reduces the consumption of coal by the city.

⁂

New Mexico Breaks Record

The production of coal in New Mexico in 1914 was 3,877,689 short tons, valued at $6,230,871. This was the greatest coal output in the history of the state, according to C. E. Lesher, statistician of the U. S. Geological Survey.

New Mexico is the only one of the Rocky Mountain states in which more coal was mined in 1914 than in 1913. The increase of 168,823 tons in quantity and $829,611 in value is due to the greater output from Colfax and Santa Fé Counties, which, being on the east front of the Rocky Mountains and not far distant from the larger Colorado fields, were able to supply a part of the demand normally furnished with coal from Colorado, from which the 1914 production was restricted because of the continued strike.

⁂

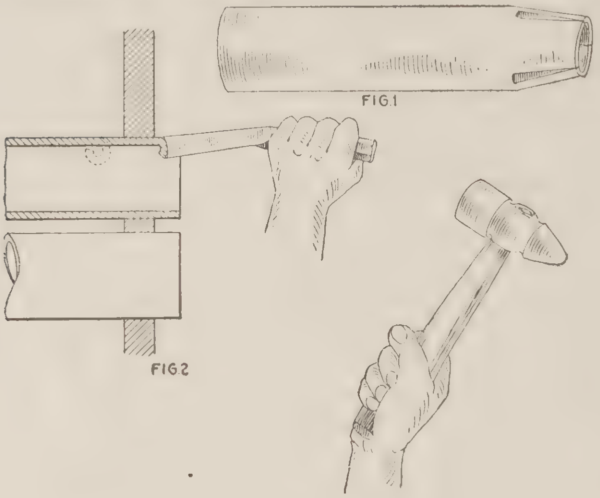
Regarding the limit of depth in mining, Joseph Dickinson said: "Some people are talking now of 5000 ft., and I should think that it may be obtained hereafter by means of shorter shifts, taking a man out from the face and allowing him a little respite and time to cool, and by the use of some of the modern cooling adjuncts. I do not know what effect ice machines will have in the working-face, and I do not know what effect liquid air will have; but compressed air when liberated produces a degree of coldness sufficient to freeze small valves of air machines, and that would have a cooling effect in a mine. We have by no means exhausted the cooling powers within reach of the miner at present."

Removing Boiler Tubes

In removing tubes from boilers, if the entire set is to be removed and replaced, they may often be cut from the inside and allowed to drop, to be taken out through the manhole.

Where only one or two flues are to be taken out, this method is impossible. In that case one or more flues may be removed by means of a ripper, which cuts the flue, allowing it to be slipped endwise through the tube hole. The accompanying illustration explains this method.

A curved ripper, Fig. 1, should be used, as it tends to force the flue inward as it is cut, thus preventing the bulges that are sometimes made when a straight ripper is used. By keeping bulges out of the flue, it is easily slipped through the tube sheet.



Method of Using Ripper

Discrepancies in Boiler Usage

By C. W. Crawford*

An error unchallenged and unnoticed for years becomes a habit as persistent in perpetuating itself as does an actual fact. The too-frequent wrecking of hoisting engines in coal mining indicates an error somewhere. When an engine goes to pieces all of a sudden, there is something wrong, and the cause is frequently regarded as a mystery and any attempt at explanation is accepted with suspicion.

It is no trifling cause that breaks bed-plates, cranks, pistons or whatever is weakest, but after all it is inexcusable and preventable. The presence of water in the cylinder is uncalled for, but how it came there is the real problem. There is no power derived from it, and therefore the less of it the better. It doesn't come through careless handling of the engine. It is an intrusion. Its source is the point to be sought after.

It comes from the boiler. The force that causes it to leave the boiler is the steam as it travels to the engine. Ordinarily it is in the form of fine spray. The force that starts the spray from the boiler has also the greater effect of starting solid slugs of water, when the conditions are favorable therefor, and when once a slug of water is started in the pipe it is compelled to go through, and disastrous results may follow.

It is pertinent to ask why the water is thus caused to leave the boiler. It will be difficult to get engineers who are trained to the present conditions to believe the real cause when it is pointed out. This problem was thrashed out years ago when the principal large boiler plants were located on steamboats. In those times similar accidents occurred frequently; cylinder heads were knocked out, connecting-rods and cranks were broken, etc. Steam drums (or header lines) and outlet pipes from the boilers were enlarged to more than double the capacity of those formerly used, and the trouble ceased. The steam drums were of large capacity, 30 in. or more in diameter, and the boilers small, with diameters from 38 in. to 42 in. Though the standard steam legs of our present 72-in. 150-hp. boilers are only 6 in. in diameter, the old-time boilers would have been furnished with steam legs with a diameter of 9 in.

For further comparison, a steamboat having 24-in. cylinders, 8-ft. stroke would have five boilers 25 ft. long of above diameter, while an uptodate hoisting engine with 24x36-in. cylinders and the same piston speed would require two boilers 72 in. diameter, 18 ft. long. The velocity of steam leaving the former (five outlets) would be 861 ft. per min. and in the latter nearly 5000 ft. per min. Header lines 16 in. in diameter are assumed to be sufficient on large modern boilers, so they are installed either without domes or with these accessories not nearly as large as they should be.

The boilers of the present time are excellently made and embody the best of material and are, as such, all that can be asked for, but it would seem that a mistake has been made in adopting a standard outlet steam opening, so small as to compel a steam velocity so rapid as to bring over the spray from the boiler without providing any means of separation.

An efficient separator will generally insure reasonably dry steam, if the right sort of separator is chosen; but the spray or solid water ought never to have cause for leaving the boiler.

There isn't much dignity in borrowing from the practice of 50 years ago, but the right must prevail in the end. Another good point from steamboat practice is making the end of the steam pipe project several inches into the drums or header line. This is an efficient aid in heading off the entrained water from passing on to the engines.

In any well-conducted boiler and engine plant 12 to 20 lb. of water (steam) per hp.-hr. is sufficient for reasonable economy. A consumption of 20 to 30 lb. per hp.-hr. represents roughly the average of hoisting engines, the difference being a useless quantity of water heated to the temperature of the steam, and which exerts no force and is a detriment to lubrication as well as to economy of coal.

⁂

Operator's Duty to Furnish Headers—Where headers are customarily or necessarily used in mining, they constitute "caps," within the meaning of the Kentucky mining statute which requires an operator to provide miners with a sufficient number of caps and props. And where an operator is bound by this law or by contract to furnish headers, the miner does not assume the risk of being injured in consequence of the operator's neglect to supply them after repeated requests, unless he is chargeable with knowledge as to a loose condition afterwards causing him injury. (Kentucky Court of Appeals, Big Branch Coal Co. vs. Wrenchie, 170 Southwestern Reporter 14.)

The Labor Situation

On July 6, John P. White, president of the United Mine Workers of America, will commence a two months' membership campaign in the anthracite region. It is the hope of the union that every mine worker will become a member of that organization. Mr. White's first meeting will be at Carbondale in the northern district. He will attend the convention of District No. 1 at Scranton, beginning July 19, and will be present at the tri-district convention at Wilkes-Barre, at which the demands on the operators will be framed. The three anthracite districts are Scranton or No. 1, John T. Dempsey president, John Mack secretary; Hazelton or No. 7, Thomas Kennedy president, John Yourishin secretary; and Shamokin or No. 9, James Matthews president, James J. McAndrew secretary.

Possibility of a Lockout in Ohio

The arrangement between the eastern Ohio operators and the union conformed with the letter of the agreement which the latter made with the Hocking Valley operators. The miners said they would not settle the strike in eastern Ohio unless they received 47c. per ton for machine-mined run-of-mine coal. They kept that promise, but the Hocking Valley operators declare it was kept only to the ear and not in principle, seeing that it was offset with a number of valuable concessions. They consequently are making a thorough investigation to see whether they have a valid reason for attempting to overthrow their agreement with the miners. Their agreement with the union favored them, and they think they are in danger of losing the advantage gained.

The miners in the Ohio region have lost ground everywhere by the action of their union. They advocated a uniform scale based on the state average. This favored the Hocking operators, and accordingly they signed. On the other hand the uniform scale injured the eastern Ohio operators, so they refused to sign until concessions had been made which offset, and possibly more than offset, the demanded price concession. This was a bad situation; the Hocking men had reduced their wages to increase the wage of the Belmont men and then the latter made concessions so that in no real sense was the increase that they sought obtained

Now, the Hocking operators, denying that they have been delivered what they bargained for, are disposed to overthrow an agreement which they truly say was only conditional. The only dispute is whether the conditions have been really met. If the investigation proves or seems to prove that the deadwork and other concessions make important changes in the cost per ton, then the operators of the Hocking Valley, Jackson, Pomeroy Bend, Crooksville and Massillon districts will meet to discuss the issue and may cancel their contract.

Albasin Has Been a Good Leader

President C. J. Albasin, of the eastern Ohio district, denies the report that he will resign and says he is at a loss to explain the rumor. He is now serving his second elective term, which started Apr. 1 of this year. He appears to be a good executive in many ways. The fault in conducting the campaign, involving as it does all Ohio, can hardly be rightly ascribed to him. There was little or no violence during the strike, and this was largely due to Albasin and his lieutenants, who strove to keep down the unruly Industrial Workers of the World. There was a large amount of pilfering and some cases of robbery, but only because Albasin did not have at all times perfect control of the foreigners in the union.

The attempt to raise wages in one district and to lower them in others was a folly of follies, for it could only result in failure to raise wages and in success in lowering them, and now it seems that the operators whose rates were lowered are not satisfied. There is this gain, however—that Ohio may, as a result of the readjustment, gain a widened and steadier market as soon as times are better and the markets, lost during the strike, are recovered.

John McLennan, president of the United Mine Workers of America, is starting an agitation to have John D. Rockefeller, Jr., convicted of murder, arguing that as he was directly responsible for hiring the mine guards at Ludlow, he was to blame for their actions just as John R. Lawson was held to be chargeable for a murder committed by men under his direction.

The Carr mine of the Carr Coal Mining & Manufacturing Co., south of Leavenworth, Kan., is idle because of a dispute between the superintendent and the 200 miners. Two weeks ago a flood caused water to run down the air or escape shaft, and when the superintendent found that the fans were not able to force enough air through the mine he decided for safety's sake not to operate on that day. For this reason the pit committee called the men out, and they have not been at work since. A deputy state mine inspector examined the shaft and pronounced it in good condition.

Development of a Chinese Coal Mine

The Yingmaoyeh coal mine, says Consul General Horace Remillard, of Hankow, in *Commerce Reports*, is situated in the district of Puchi, in the Wuchang prefecture of Hupeh Province, in a large coal region on the Hunan border. Mining by native methods has been carried on there all along, but foreign machinery has recently been introduced, in connection with foreigners acquiring an interest in the development of the properties. Arrangements were made before the revolution for the exploitation of the Yingmaoyeh mine, but it is only two years since it was possible to make a start. Machinery was brought out from home and a foreign engineer engaged, and now two shafts have been sunk to the seam, which lies at a depth of 250 ft. and is 9 ft. thick. There is a steady daily output amounting to 2,000 tons per month.

The coal is a hard anthracite of great lasting power and burns clean away, leaving as its only residuum a little white ash. It consists of 78.81 per cent. of fixed carbon, 14.88 per cent. of volatile matter, 0.17 per cent. of sulphur, 5.29 per cent. of ash and 0.85 per cent. of moisture.

The chief trouble to be overcome in connection with the mines has been a superabundance of water, but a system of electric pumps has overcome that difficulty. A third shaft is now being sunk, which will be completed by August, and then the output of the mine will be doubled. At present 630 men are employed in various capacities.

The coal has to be carried by coolies to the waterway at Puchi City, a distance of 25 li (about 8 mi.), where it is put on board chartered junks, and has hitherto been sent to Shanghai, where it meets with a ready market. Arrangements are being made to have it put on sale in Hankow. A large consignment has arrived, and it is expected from the superior qualities of the coal that the output of this particular mine will become very popular. It is easily lighted and has great heating power and no smell or dust.

COMING MEETINGS

American Institute of Electrical Engineers will hold its annual convention June 29 to July 2, 1915, at Deer Park, Md. Headquarters will be at the Deer Park Hotel. Secretary, F. L. Hutchinson, New York.

American Mine Safety Association will hold the following meets: July 2-3, Big Stone Gap, Va.; July 23-24, Billings, Mont. Secretary, H. M. Wilson, 40th and Butler St., Pittsburgh, Penn.

Alabama Coal Operators' Association will hold its annual meeting at Edgewater, Ala., on July 10, 1915. James L. Davidson, secretary, Birmingham, Ala.

The Order Kokoal will hold its annual pow-wow at Chicago, Ill., July 13 and 14, 1915.

The Southern Appalachian Coal Operators' Association will hold its semiannual meeting July 23, 1915, at Knoxville, Tenn. J. T. McCoy, Knoxville, Tenn., is secretary.

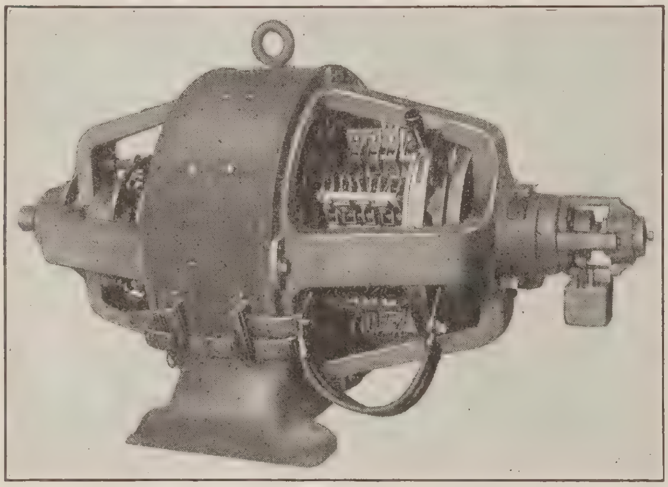
The United First-Aid Corps of the 4th district, Delaware, Lackawanna & Western R.R. Co.'s coal department, will hold its third annual first-aid contest at Harveys Lake, Penn., on Aug. 14, 1915. Secretary, Lewis Richards, 212 East Green St., Nanticoke, Penn.

The American Mining Congress will hold its 18th annual session at the Exposition Memorial Auditorium, San Francisco, Calif., Sept. 20-22, 1915. J. F. Callbreath, secretary, Majestic Bldg., Denver, Colo.

New Apparatus and Equipment

Rotary Converters in Mining

It is interesting to note the favorable impression being made by the rotary converter in coal mining, particularly since the manufacturer has developed the new commutating-pole machine in the smaller sizes. One of the chief troubles in mining work, particularly with small rotaries, has been commutation. The mining load varies anywhere from 10 per cent. of full load to 100 per cent. overload in a short space of time. With the noncommutating pole rotary, it was necessary to shift the brushes with the change in load, or sparking and damage to the commutator would result. This would end finally in short-circuited coils and burnouts.



The New Rotary Converter

Since the application of commutating poles, a machine normally designed for a 35-deg. rise in temperature at full load will carry a 50-per cent. overload for 2 hours with a rise not exceeding 55 deg. and a momentary overload of 100 per cent. without the least sign of sparking. In the commutating-pole design the brushes are set on the neutral point and fixed there, and the varying loads have no effect in so far as sparking is concerned.

The Westinghouse Electric & Manufacturing Co. recently received an order from the Stonega Coke & Coal Co. of Virginia for 24 commutating-pole 150-kw. rotary converters, wound for six-phase 60-cycle 275-volts direct-connected and operating at a speed of 1200 r.p.m. These will be placed in 12 underground substations which will be supplied with power purchased from the Kentucky Utilities Co. The power will be delivered to five points at a voltage of 33,000 and stepped down to 2300 volts, at which potential it will be transmitted to the mine, where there will be two banks of transformers, each consisting of three 50-kv.-a. single-phase machines wound for 2300 volts on the high-tension and rotary voltage on the low-tension side. Each substation will be controlled by a five-panel switchboard.

Another installation, similar except that it will be above ground, is that of the Conemaugh Smokeless Coal Co. in the Pittsburgh field. This installation consists of one 200-kw. rotary converter with the same characteristics as those for the Stonega company. This machine is of the bracket type, as will be seen from the accompanying illustration. The frame is of rolled steel, the feet being pressed out of a single sheet. This type of machine is built in three sizes which are popular in the mining field—100, 150 and 200 kw.

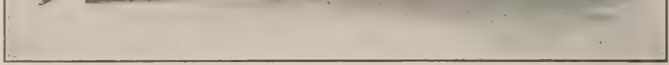
The Westinghouse company has also built a new type of this machine in the larger sizes, having furnished one 300-kw. 275-volt rotary converter of the commutating-pole type and a machine similar in design of 500-kw. capacity to the Lehigh Coal & Navigation Co., at Lansford, Penn.

⁂

The Halby Shoveling Machine

The efficiency of drilling machines has been increased many-fold in the last few years, but a great loss of time and money in driving drifts and tunnels at present is still incurred in mucking. After the material is broken, with but few exceptions mine operators are still using the methods of loading by hand which were in vogue over 2000 years ago. Recently the Halby shoveling machine, manufactured by the Lake Shore Engine Works, of Marquette, Mich., has been operated successfully for six months in one of the iron mines of northern Michigan, under the most varied conditions.

The most important factors which a shoveling machine should possess were carefully considered in this design. They are as follows: The first cost should be moderately low. The machine must be handled by miners and should be free from all complications. It must handle material consisting of the finest grains up to large pieces, material both wet and dry, and stand severe treatment as well as great wear and tear. The cost of upkeep must be low. The motion must be such that if any firm object is struck the mechanism will not be damaged. The machine must be small and compact.



The Machine Loading a Car

This shoveling machine was first demonstrated at the plant of the Lake Shore Engine Works last fall, at the meeting of the Lake Superior Mining Institute held on the Marquette Range. After the meeting it was shipped to the Judson mine at Alpha, where it is at present loading a 2-ton car in an 8x8 drift in 1½-min. when the loading conditions are average—that is, when there is a fair-sized bank of ore in front of the machine. At times the ore bank is small and scattered so that under these conditions it takes as much as 4 min. to load a 2-ton car; but an average loading time is a 2-ton car in about 3 minutes.

Formerly, with hand labor, it required two men shoveling 20 min. to load a 2-ton car under the same conditions as the machine is now working. The machine requires about 200 cu.ft. of air per min. The cost of operating for an 8-hr. shift is approximately as follows:

Power	$3.00
Runner	2.50
Interest on investment	.20
Repairs	.50
Oil, etc.	.17
Total cost per 8-hr. shift	$6.37

Figuring 200 tons loaded per 8-hr. shift this shows a net cost per ton of $0.031. The labor expense of two men loading for an 8-hr. shift would be $5 per day. Under similar conditions they would load approximately 40 tons in 8 hr., or a cost of $0.102 per ton. The Halby shoveling machine, therefore, loading for less than one-third the cost, at the same time loads five times the tonnage.

The overall length of the machine when ready for operation is approximately 15 ft., but the machine can in a few minutes be shortened to an overall length of 10 ft., if especially short curves or limited space should make this necessary. The overall height of the machine is 5 ft. 4 in., and the total width approximately 4 ft. The total weight is 7500 lb.

The machine is made up in three distinct sections, each forming a unit by itself. The top section contains all the working parts for the conveyor and shovel mechanism. The center or power section contains the motive power, all the clutches and the driving gears. The lower or truck section serves as a support for the entire machine. The top section can be lifted off the center section by removing two caps at the top of the side frames. The center section can simply be lifted from the truck, there being no bolted connections between them. This construction feature makes this loader especially adapted for mine and tunnel work where it often becomes necessary to move through openings too small to allow the entire machine to pass.—*Engineering and Mining Journal.*

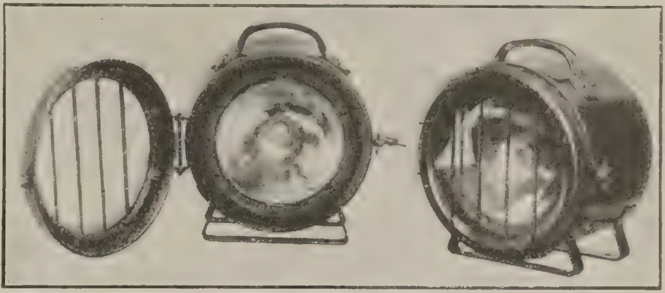
New Mine Locomotive Headlight

Many mine operators have long wanted an incandescent mine-locomotive headlight to replace costly arc lights or inefficient carbon bulbs. To meet the demand for such a headlight the Esterline Co., of Indianapolis, Ind., has recently perfected what is called the "Golden Glow."

This headlight is similar in design to the Golden Glow railway headlights which have been widely adopted in the past 18 months, because of their mirrored glass reflector and their fog-penetrating, nonblinding light. Exhaustive service tests have been made on the new headlight, and the result indicates that equipment may now be obtained which will give long bulb life, reduced current consumption and maintenance expense and give a nondazzling, keenly penetrating illumination.

The new headlight, as may be seen from the accompanying illustration, is really a lamp within a lamp, the interior lamp body carrying a 7-in. mirrored glass reflector and a Mazda bulb, so supported that the constant jarring and pounding incident to this service will not break the filament. The headlight is practically watertight.

Particular attention is called to the advantages which the Golden Glow light presents in a restricted space over the dazzling glare of an arc. Men ahead are not blinded or confused and may work in its light beam at close range or at considerable distance with equal ease. In fog it secures projection not possible with any white light.



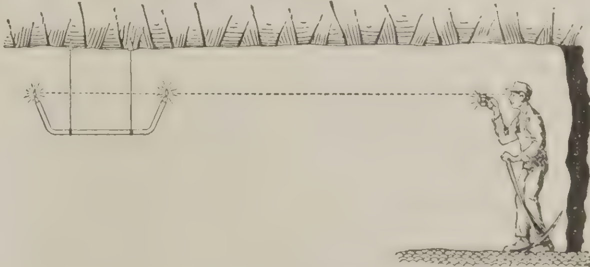
THE NEW HEADLIGHT

In electric railway and tunnel service over 6000 Golden Glow headlights are in use, and during four years not a single accident has been reported on account of lack of light or an inability to see an approaching car.

A reduction in cost of headlight operation has been long sought. The current consumption of the Golden Glow headlight is reduced from that of a 4-ampere arc light to ⅓ of an ampere with a 36-watt bulb, or ⅕ of an ampere with a 23-watt bulb. Furthermore, the expense of maintenance of arc lights, such as the cost of parts, replacement, cleaning and adjustment, has been reduced to the renewal of incandescent bulbs.

Novel "Sighting" Apparatus

The accompanying illustration shows an apparatus which will materially facilitate "sighting" places in the mines which are being driven on line. By means of this instrument the miner at the working face of a tunnel or drift can determine the true direction in which to advance.



METHOD OF USING SIGHTING APPARATUS

The target consists of a telescope bar having upturned ends in which candles are placed. The bar is provided with hooks to which cords are connected and fastened to the plugs in the roof of the tunnel. The bar thus extends in the true direction that the tunnel or drift is to take.

The candles in the target being lighted, the miner at the working face of the tunnel holds his candle so that it is in line with the two in the target, and in this way he is able to tell at any time the proper direction in which to advance. The inventor of this device is Frank Higgins, Box 218, Mulberry, Kan.

Editorials

Michigan's Low Death Rate

However high the State of Michigan may rank as a manufacturer of automobiles, house-heating appliances and furniture it can by no means be considered as a great coal producer. During the past year its output of coal amounted to 1,238,030 tons, or slightly over one-fifth of 1 per cent. of the production of the entire country. There is one circumstance, however, in connection with this coal output that practically places Michigan in a class by itself—only two deaths through accident occurred during the entire year. This corresponds to a production of 641,515 tons for each life lost.

While it will readily be conceded that many individual firms produced during 1914 tonnages per fatality vastly superior to the above, yet no other state considered as a whole has such an enviable record. The death rate per 1000 men employed in and about the mines in Pennsylvania was about 2.35, in West Virginia it was 7.43, in Illinois 2.43, in Missouri it was 1.82, while for the entire United States it was 3.3. Michigan's death rate per 1000 men employed in coal mining shows a marked contrast to the above, being 0.87.

As all mining men know, a low death rate either per thousand employees or per million tons of production may not be in anywise significant of care on the part of either miners or mine officials. Natural conditions may be such as to render operation either inherently safe or unavoidably dangerous, and the figures showing the death rate may be, and frequently are, merely a reflection of these conditions.

Whatever may be the reason for the low death rate in this state—and this death rate has not always been low—it must be conceded that in the year 1914 coal was mined there with a lesser cost in human life than in any other state in the country with an output at all comparable to that of Michigan.

*

The Enduring Conflict

Under this title one of our distinguished contemporaries has contrasted the continuance of industrial disputes with the impermanence of the present war and has argued that in England and elsewhere when the war is over class consciousness will take up the gage of battle after national consciousness has ended its warfare.

Before discussing this statement, however, it must be remembered that the word "consciousness," while often used of a correct sentiment, usually means something more in the mind of the socialists and labor leaders who invented it. In fact "consciousness" is frequently also a euphemism for "aggressiveness," and it will be used in this sense in the paragraphs which follow.

Where that quality is merely self-recognition it is fair and reasonable and no one can find fault with it. Surely no one would wish that in any class, sex, nation or creed the members should be so supine as not to seek their inherent rights to self-expression and equal opportunity.

In what follows, therefore, consciousness will be used not so much in its correct but in its popular usage as a recognition of one's power of aggression and a determination to use that power to its fullest extent.

The continuance of struggles derived from such consciousness, as endless as they are implacable, bodes no small degree of misery to the human race. But with judgment all forms of consciousness, whether of nation, class or sex, may be prevented from dividing mankind. At one time creed consciousness separated us, and we killed it or nearly killed it by forgetting it. Our national divisions are about to die also, not so much as a result of action as by reason of our knowledge that there is nothing national to be really conscious—that is, aggressive—about.

And class and sex consciousness, lately so loudly heralded, will pass with the rest into the limbo of forgotten separations. But this change will not come as the outcome of legislation; at least the laws we pass will have little influence in the result.

It is not well here to take up dogmatically the question of the value of laws in stemming any kind of intemperance, whether it be that of the body or of the mind. But it may be well to recall that it is asserted that the laws favoring prohibition have done more harm than good, and perhaps legislation restraining intemperance in labor agitation may not have any better result. It is not to laws but to character that we can best ascribe the decline of that creed consciousness of the past which had so many victims, and not to legislation but to self-restraint must we look for a gain in temperance. So also the contentment of labor is to be sought similarly in a correct attitude toward labor problems rather than in statute law.

Consequently all the clash about injunctions, the Clayton bill, incorporating unions and like legislative enactments are interesting and perhaps important, but must not be regarded too seriously. The prime necessity is to destroy class consciousness by a generous sense of the importance of class interdependence.

This work is the main duty of the next half century. The large corporation is separating operators and men. What is it doing to correct this evil; for having created the difficulty it should attempt to remove it? In most cases it is creating much trouble by continually changing officials between whom and the miners in the short period of their contact no sympathy or sentiment is likely to spring up. Foremen are shifted and discharged to satisfy expediency or efficiency without regard to the fact that, like gears, men run smoothest that for awhile have been running together.

It is not enough to say that small corporations are as much disposed as large to change their mine foremen frequently. That is quite true, but in these small concerns there is always the operator as a permanent representative of the company, and he is often far closer to the man at the face than the foreman at a large mine.

As a result of frequent changes at the mines of large corporations, there is often no one to whom to be loyal, no one to personify the company. The agricultural workmen from Europe who come to our mines hardly know what a "company" is. They are prepared to be loyal to someone in authority, but the man to whom they *could* give their allegiance stays so short a time in control that the loyalty is not won, and then also the man himself too often stays only a month or so and does not have time to develop any such an attachment.

It is not sufficient for a company that its directorate be composed of men who are fair and just. Its officials from top to bottom must be men who inspire loyalty and trust. There must be a degree of permanence in their tenure of office and in their methods of operation so as to create these qualities. A new official is a distinct shock to an organization. Everyone is prepared to resist the changes he makes, for fear they may not be for the benefit of the individual so resisting. Where changes are frequent, therefore, loyalty is impossible.

The most successful companies are those retaining men in office whose personality is so marked that the men work for the official and not for the company. If absentee management is to continue—and it will—and if it is to succeed—and it must—then we must find a way to make it not absentee at all in action, but must have the local boss a visual representative of the men at the home office.

We have been too careless of our duties in this respect. Many a man of character and friendliness has put a browbeater, a narrow, irresponsible man in charge and earned the ill-will of his men thereby. And many operating heads have changed their bosses needlessly and have lost the attachment of the men to the old official, which was worth as much as the greater efficiency of the new.

Many men have not scrupled to let old miners go and bring in new men in their place every day. The commonest sight at a mining village is a "flitting." The men go and come daily and there can be no basis for loyalty.

You know how it is in your own office. You know that you have men who seemed undesirable at first till you knew their ways and how to take them. They grew on you. The miners are just like you are—ruffled up at first with every unexpected characteristic of a new man, untrusting, uncertain and suspicious. Time removes those difficulties, so that even a man's faults are soon regarded as inevitable and natural.

Then just as everyone begins to move in his sphere without friction the man in charge is removed, and the shock is given and all the work has to be done over. Or the miners leave and are replaced and the loyal, or at least contented, force is replaced by strangers who have no friendliness with the boss, no attachment to their homes and a sort of grouch for everything and everybody.

The itinerant mine foreman is a menace to the industry, but it rarely is his fault that he stays so short a time in one place. The miner who moves from colliery to colliery is another source of discontent, and he also is not always to blame for so frequently placing his belongings on the moving wagon.

In a village where the people have known one another for years it is hard to introduce an atmosphere of doubt and suspicion, but where the continued shifting of men has made them all strangers to one another almost any story can be believed and any misfortune may be feared. If then peace is to replace class conflict, an attempt must be made to stabilize the population so that a community interest will be built up.

The Ebb and Flow of Alien Labor

The falling off of immigrants has been accompanied with a large increase in the number of returning foreigners. In the ten months ending May 1, 1915, the ratio of departing foreigners to those entering is 92.6 per cent. The net gain is only 28,364 men. The following table shows the record of arrivals and departures since 1910:

Year Ending June 30	Total Aliens			Ratio of
	Arriving	Departing	Net Gain	Departing
1915*	373,382	345,018	28,364	92.6%
1914	1,403,081	633,895	769,276	45.1%
1913	1,427,227	611,924	815,303	42.9%
1912	1,017,155	615,292	401,863	60.5%
1911	1,030,300	518,245	512,085	50.3%
1910	1,198,037	380,418	817,619	31.8%

*Ten months to May 1, 1915.

The unfortunate part of this loss of men to Europe is that it removes the most energetic workers. At other times we might congratulate ourselves that those returning are men too old to work or misfits or men too much bound by home ties to become nationalized and settled. We might congratulate ourselves on their loss, for we might well say they could no longer work or never were any good or were men hopelessly inassimilable.

But the men we lose to the war are young and active men with ideals, in many ways the pick of the workingmen in the countries they come from. The other countries gain by their return as we have gained by the coming of the more active men of Europe.

Moreover, we have broken them to our needs and industries and have given them a smattering of our ideals and our language. We have imparted to them all a degree of instruction which is now largely thrown away, for only a few will return when the war is over.

The shiftless, the unenterprising and the old will remain, and in a degree America will suffer from that deterioration of laboring personnel which has occurred in Europe as a result of the lure of America.

The public press has discussed the lack of interest in the employee due to absenteeism of the employer. It is true that the ends of democracy and the need for sympathy cannot be compassed under absenteeism. However, the evidences are that the operator is showing more interest than ever in the welfare of the employee despite his abstention from that employee's working place.

But if the operator has been growing away from the miner, still more has the miner been getting out of touch with the operator, whose language he no longer speaks and whose name even he probably too often does not know.

Some of the smaller companies have wretched living conditions; the mines are full of puddles; conditions of work are grievously unfavorable. But the miner in these smaller operations knows his boss. He feels that his employer is a man, not perhaps his ideal of a man, but still a man; and somehow there are no strikes and sometimes the men will work for him at much less than the union scale despite all the inconveniences with which their labor is encompassed.

The importance of this unity of feeling between worker and employer emphasizes the fact that the men who have learned English and know something of the company and the boss are an asset, and the occurrence of war that takes them away, that kills them, and sends us others whom we do not know, and who will be years learning to know us, is a distinct loss.

Discussion By Readers

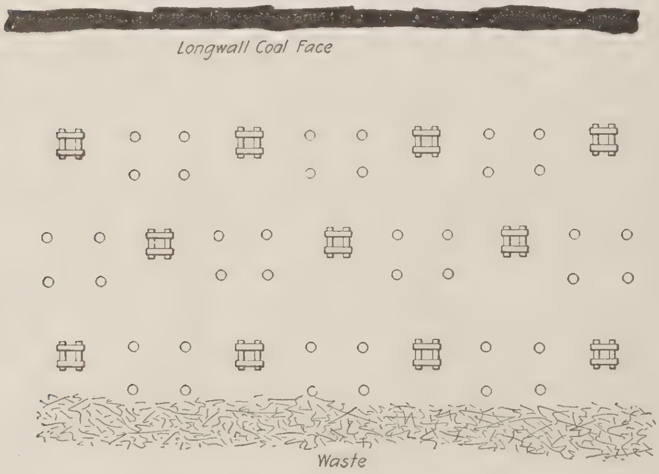
Longwall in Pittsburgh Seam

Letter No. 11—I noted with interest that Mr. Brown, in his Letter No. 8, Coal Age, May 29, p. 939, is of the same opinion that I expressed in Letter No. 7, May 15, p. 859; namely, that longwall advancing cannot be successfully employed in working the Pittsburgh seam, chiefly because of the impossibility of maintaining the haulage roads.

Mr. Brown presents an excellent block or panel system for mining this seam. I think, however, that if he will carefully study the retreating system presented in my previous letter, he will admit that it possesses certain advantages over his proposed block system.

I freely admit that the block system presents a decided advantage in the early stages of the development by permitting a larger output of coal earlier in the game. But to offset this advantage, the system requires the driving of a large amount of narrow work, which is expensive.

Comparing this method with the retreating plan I presented, it will be observed that my entries are driven directly to the boundary; but I believe that their expense is fully justified by the large amount of working face thus developed, which means much cheaper coal and a large output at once becomes available. It must be acknowledged, also, that the roads are more permanent and there is less shifting of tracks and changing of switches in the retreating plan, which means a great decrease both in cost of maintenance and in the operating expenses.



Showing Cribs and Posts at Working Face

One of the most important features of the longwall retreating plan is the protection it affords against the occurrence of creeps and squeezes. The same protection is not afforded by any plan of mining that provides for a large extraction of coal in the early stages of development. Another feature that can be urged in favor of the proposed retreating plan is the facility it affords for good drainage. The diagonal roads in this system invite natural drainage to a greater extent than where the butt- and face-headings are driven at right angles to each other as in the panel system. This feature tends to reduce the necessary expense for draining the mine.

In addition to the explanation given in my previous letter, the accompanying sketch shows the plan of cribbing at the working face. In order to support the enormous roof pressure, I would suggest carrying three rows of cribs. These should be built of hardwood blocks 4x4x18 in., and spaced 10 ft. center to center. Where the roof is quite frail, four posts should be stood between adjoining cribs, as shown in the figure; also, the cribs in the three rows should be staggered, as shown. When undermining the coal, sprags should be set 5 ft. apart. The coal may then be cut across the entire face of 100 ft., which is a great advantage in machine mining. The sprags are easily drawn, or knocked out after the cut is made and the miners are ready to leave the place.

Such a system removes all danger of roof falls where the miner keeps his place in good order and takes the necessary precautions for his own safety. No coal is lost, and there is less dead-work caused by the presence of clay veins, which are often troublesome and greatly increase the expense in the room-and-pillar system, while in longwall-work they can often be left to gob themselves.

John Oldroyd.

Farmington, W. Va.

Letter No. 12—Reading the numerous letters published in Coal Age in reference to the application of the longwall method of mining to the working of the Pittsburgh seam in eastern Ohio impresses one with the idea that the scheme is impracticable at the present time.

While there is no doubt in my mind that the Pittsburgh seam can be worked successfully on the retreating plan of longwall, to which reference has been made, I believe there is more need at present of discovering a system of room-and-pillar mining that will increase the recovery of coal in this seam without adding to the cost of production. It is no time now to experiment on the adoption of the longwall method in this seam when labor conditions are so disturbed and the profit on coal is at a minimum. Let a more favorable opportunity be chosen for investigating this question, but for the present let us strive to reduce the large percentage of coal left in the seam by adopting some simple modification of the present plan of mining.

All the conditions affecting the mining of coal in the No. 8 seam are well known, and having this knowledge, it should be possible to estimate with considerable accuracy the probable cost of mining by any proposed method. Moreover, the longwall method has been tried on several occasions in this district, and one can ascertain by making inquiry what results have been obtained in its use. Owing to the large outlay of capital necessary for the development of the longwall *retreating* system, it is plain that the *advancing* method presents the only feasible plan.

In considering the general question of longwall, regard must be had to the fact that the hard limestone above the

Pittsburgh seam is separated from it by a stratum of soft slate of varying thickness. This makes it practically impossible to secure a break in the limestone which is so important and essential for the success of any longwall method of mining. As the coal is taken out, the soft slate immediately above it falls. The broken slate occupies more space than it did in the solid formation, and as a result there is not sufficient room for the settlement of the limestone to cause a break. There would be more chance of getting a break if the limestone laid directly above the coal, as it would then have a drop of practically 6 ft., or the thickness of the coal seam. Instead of this, however, the limestone now settles gradually onto the broken slate beneath, and no break occurs.

Some time ago Mr. Waddell, Letter No. 6, Coal Age, Apr. 24, p. 732, stated that longwall was being used in various localities in Pennsylvania, West Virginia and at points on the Norfolk & Western Ry. He must remember, however, that those places have altogether different conditions of roof, coal and bottom and, moreover, that the labor conditions are frequently quite different from those in eastern Ohio, the latter being far from what might be desired. With unfavorable labor conditions and freight rates, the eastern Ohio operator must be quick to avail himself of the opportunity to profit by any suggestions that would enable him to recover a larger percentage of coal.

In my opinion, if such a thing had been possible, one of our district operators would have long ago devised a way for a larger recovery of coal in the working of this seam in eastern Ohio. At present they are anxiously awaiting some suggestion of a plan that bids fair to succeed. It is useless, however, to compare this district with work in the Fairmont field of West Virginia, where, under more favorable conditions, the operator is enabled to recover 95 per cent. of the coal in the seam. The eastern Ohio operator would be glad to recover 90 per cent. of his coal by any practicable method.

Mining Engineer.

Wheeling, W. Va.

Value of Coal Analyses

Referring to the inquiry on this subject by N. G. Near, Coal Age, June 19, p. 1072, I may say that opinion is naturally divided on the points presented therein. It is common to hear criticism of this nature, and in the hope of convincing at least some skeptics I offer the following remarks.

Before taking up the subject matter, however, and for the benefit of many whose ideas of coal testing are, to say the least, vague, permit me to digress for a moment and give a brief outline of the scope of such an analysis. For example, a complete commercial coal analysis includes the following determinations:

Moisture—In bituminous coal this should not exceed 1 per cent.

Volatile Matter—This is not all combustible matter. Hence, a coal whose volatile products are more largely combustible has more heat value than a coal whose products are partly incombustible. Such incombustible volatile matter dilutes the combustible portion and, by absorbing some of the heat, lowers the heat value of the coal. This constituent cannot therefore be considered a reliable factor in determining the heat value of a coal.

Fixed Carbon—This is the free carbon content of the coal and is the chief source of heat when the coal is burned.

Ash—The ash is composed of the mineral content or impurities of coal and is, to a greater or less extent, a necessary loss in the production of power by the combustion of coal. The ash not only affects the heat value of the coal, but its final disposal involves a necessary additional expense. The nature of the ash (high or low fusing point) makes a great difference in stoking, by causing the formation of clinkers and destroying the grate-bars, which in many cases must be replaced at frequent intervals.

Sulphur—This constituent when found in coal is generally combined as iron pyrites. It is of course injurious and troublesome and acts to rapidly destroy the grate-bars of the furnace by combining with the iron.

Heat Value (B.t.u.)—The heat value of coal is measured, in this country, by the British thermal unit (B.t.u.) and is of the greatest importance in determining the value of coal for fuel purposes. This unit expresses the amount of heat required to raise 1 lb. of water 1 deg. Fahrenheit.

Lack of space will not permit of the discussion of the relative value of different coals used for fuel purposes, and it will therefore be necessary to consider only bituminous coal as used for steam purposes. With this preliminary, I will proceed to answer, as far as I may be able, the points suggested in this inquiry.

The mining of coal, in general throughout the country, follows a fixed method of procedure. The coal is broken from its bed in the underground workings of the mine, brought to the surface in mine cars and dumped over screens at the tipple into the waiting railroad cars. The arrangements for screening and cleaning the coal vary at different mines, and the results obtained, in this respect, depend largely or wholly on the equipment at the mine, the honesty of the operator supplemented by the capability of the superintendent and the thoroughness of the men engaged in this work.

Inasmuch as no two seams of coal are exactly alike in quality, and since other conditions under which the coal is mined vary widely, not only in different mines, but from time to time in the same mine, one can readily see that the quality of the coal loaded for shipment will vary widely. Under conditions most favorable to the purchaser of fuel, the value of the coal loaded in each car can only be determined by analyzing a carefully prepared sample of its contents. The uptodate mine, therefore, will check its shipments of coal from day to day by making analyses to ascertain that the operations in the mine are being conducted properly and that the specifications required by contract are being fulfilled.

While it is absolutely correct, as has been said, that "We can add nothing in value to the coal by testing the shipment," it is manifestly unfair to claim that "Such work is a pure loss of time and energy," and that the coal tester is a "nonproducer," as is sometimes stated. The argument is so weak that it hardly seems worth refuting. The best way, however, to convince anyone who is in doubt in this respect is to let him make a canvass of the large manufacturing and industrial concerns. Thousands of these concerns employ a force of chemists themselves or are regular patrons of the commercial laboratory. Ask any of these interests, and their instant reply would be, "We employ no *nonproducers* in our laboratory, nor would we pay an outside commercial laboratory for testing what is of no *value* to us from a business standpoint."

In regard to the expense, I would say the cost of making such tests is not as great as many people seem to think. Many laboratories make a complete analysis for $6; or on a yearly contract the charge is about $4 per sample; while on a basis of one sample per week a yearly contract price of $200 is quoted. This certainly cannot be said to be an excessive cost when one considers that the loss on a few cars of coal of inferior quality will more than offset the bill of testing shipments for the entire year. Many plants are saving from $1000 to $10,000 or more per year by buying coal under proper specifications, while numerous other manufacturers who are not availing themselves of these privileges could save fully as much if they were alive to the importance of the work.

Inasmuch as fuel is one of the large and important expense items of every manufacturing and producing plant, the attention of all large purchasers of fuel should be directed to this matter. Other raw materials are given careful attention and the greatest care is exercised in guarding the quality by systematic analysis of the product, and the old assumption that "coal is coal" will not satisfy modern business methods. Today, the output of all other mines is sold on an analysis basis designed to determine the value of the mineral or its available contents. Coal is sold for its heat value and is therefore properly subject to the same conditions as other natural products.

Referring now to the final suggestion that "The solution of the problem is to be found in leaving the determination of the heat value of the coal to the mine operator," and the further statement that "Mine operators are not always the band of crooks so often claimed," it will be readily admitted that there is no "imputation of dishonesty" on the part of the seller because the purchaser desires to satisfy himself of the value of the product he buys. Such a method forms the underlying principle of all safe business. No honest dealer or operator will object to an analysis of the product he offers on the market.

In support of what I have said, permit me to cite a single incident of the large number of similar ones that have come under my personal observation. A 600-ton barge of coal recently shipped to a sugar refinery was instantly rejected on the report from their laboratory that the coal ran about 30 per cent. in ash. Out of curiosity to see where this shipment would finally land, it was followed, and the next day developed the fact that it was sold and unloaded at a plant across the river, which it is needless to say did not believe in testing fuel shipments. It would have astonished that manufacturer could he have discovered the amount of his loss.

Hundreds of other similar incidents could be quoted by anyone familiar with coal sampling and analyzing. When one reflects that millions of tons of coal of poor quality are mined and sold every year, the fact must be realized that much of this poor quality of fuel goes, of necessity, to the nontesting plants. It requires no argument to convince one that it would be an extremely poor business policy to leave this important matter, as suggested, entirely in the hands of the mine operator.

Not every plant could be benefited by testing their fuel purchases, because many are already getting the best coal possible for the price paid. But where the yearly consumption warrants, coal should either be purchased from a mine where the quality of its output is established, or purchased under fair specifications and each shipment tested to insure against loss.

Too much reliance is often placed in the practical knowledge and opinion of an engineer, who bases his opinion solely on the operation of the boilers. But under varying conditions of supply, coal cannot be judged correctly in this manner. Much more could be said; but I have offered these suggestions in the hope of throwing some light on a matter that is not appreciated as fully as its importance merits.

Education in Mining

Letter No. 1—I noted the suggestions of Karl F. Schoew, COAL AGE, June 12, p. 1034, urging the adoption of some practical plan for reaching miners in an educational way, and the account by John T. Bradley, Apr. 3, p. 611, of a successful mining class, I am led to offer the following remarks:

The value of vocational instruction as a means of increasing the efficiency and practical ability of men, as well as being a factor in the demonstration of the relative value and adaptability of technical ideas to the securing of practical results, has been shown through the industrial and educational departments of the Y. M. C. A. Under the supervision of this institution, a mining class was started in this place in November, 1913, and conducted for a period of six months, with sessions held twice a week. The prime object of the undertaking was to give such instruction in mining as would enable those who were ambitious to take the annual examination for mine foreman, assistant mine foreman and fireboss. Out of a class of twelve, five had the ambition and perseverance to continue to the close of the term.

The method of instruction used differed somewhat from that generally employed in this class of work. The instructor in charge of the class had learned from his own personal experience and that of others that the majority of those who studied the subject of coal mining with the object of securing a certificate of competency were men of comparatively small educational attainments and for this reason made the study of the subject a matter of *memory* and not a matter of *reason*. They committed *facts* to memory, but did not attempt to find out the reason for them. The instructor was but little better equipped in educational advantages than were his pupils, but he had discovered one important fact with respect to the study of mining; namely, that the employment of the faculty of reason was far more productive in the acquirement of technical and practical knowledge than was that of memory.

Believing that the best method of instruction to adopt was to present the subject matter in plain, simple language, and to explain each fact in a clear, concise way so as to show why it was true, he always tried to induce original investigation by asking questions to show the effects and to explain the simple, elementary laws they were being taught. The course of instruction was based on these principles and methods.

No reference books on mining were used in the class, not because books are not valuable, but for the simple reason that most textbooks did not explain the subject in a simple way, but made use of technical terms and expressions with which mine workers are unfamiliar.

That the method adopted was successful was shown by the fact that the five who presented themselves for examination in 1914 succeeded in securing certificates and that four of the class of five the following year were awarded certificates.

The Y. M. C. A. is to be congratulated on the success of its educational work in this place, not only in that of mining, but in other departments as well, and this success is to be largely attributed to the efficient management of its representative, Samuel Calverly. The only thing to be regretted is that the efforts put forth have not met with as hearty support as they deserve from those whom they were intended to benefit. It is to be sincerely hoped that coal miners may be brought to realize more fully the value and help of education in their daily work, enabling them to produce better results with less labor and in less time. The man who has trained himself to think and act in accordance with his reason has educated himself and will always excel one who performs mere physical labor. Labor is noble and dignified, but to be so it must be intelligent.

A. M. INER.

——, Penn.

Air Factor in Mine Explosions

Letter No. 1—I have read with great interest the article entitled "The Air Factor in Dust Explosions," by John Verner, COAL AGE, May 29, p. 922. I can say that I heartily agree with Mr. Verner in many of the statements made and conclusions reached by him in the study of this question. I desire, however, to take exception to one of these statements.

Mr. Verner gives as the three essential factors in the production of explosive-dust combustion the following: "1. Flame. 2. Combustible dust. 3. An air current or draft toward the source of heat, to bring the dust and air in contact with the flame."

One would infer from this statement that the air current or draft toward the source of heat is here understood to be a *factor* or the *cause* of the combustion; while, as a matter of fact, such air current or draft, as Mr. Verner explains later, is the direct *result* of the combustion.

I would suggest, therefore, that the three essential factors for explosive-dust combustion should be stated as follows: 1. Flame. 2. Combustible dust in suspension. 3. Sufficient air or oxygen to support combustion.

Study Course in Coal Mining

BY J. T. BEARD

The Coal Age Pocket Book

Specific Density—The term "specific density" expresses the ratio of the density of any elementary substance to that of the element **hydrogen,** which being the lightest of the known elements is taken as unity (H = 1). The **atomic weight** of an element referred to hydrogen is therefore the specific density of that element.

Density—The term "density" as applied to substances is used in two ways: 1. To express the **relative weight** of a substance with respect to hydrogen, volume for volume. 2. To express the **unit weight** (lb. per cu.ft.) of a substance. The density of an elementary substance is expressed by its atomic weight referred to hydrogen as unity. The density of a compound substance is equal to one-half of its molecular weight.

Specific or Atomic Volume—These terms have reference to an assumed unit volume for all gases, which **unit** is the assumed volume of a single gaseous atom.

Avogadro's Law of Gaseous Volume—This law may be stated briefly and clearly as follows:

At the same temperature and pressure all gaseous molecules are assumed to be of the same size.

With a few unimportant exceptions, this law applies to all gases, whether simple or compound. It holds true for all mine gases and is important in the calculation of the relative volumes of gases concerned in chemical reactions.

Molecular Volume—Chemical hypothesis assumes that the molecules of simple substances each contain two atoms only, while the molecules of a compound substance may contain any number of atoms, but never less than two. Notwithstanding this multiplicity of atoms, Avogadro's law makes all gases, with a few unimportant exceptions, to contain the same number of molecules, per unit volume, when measured at the same temperature and pressure.

Specific Heat—Investigation has shown that the same quantity of heat imparted to equal weights of different substances does not produce the same rise of temperature in each substance. Also, equal weights of different substances when cooling give out different quantities of heat for each degree the temperature falls. These facts show that different substances have different capacities for absorbing and holding heat as **sensible heat** causing a rise of temperature.

The "specific heat" of any substance is its **relative heat capacity,** or its heat capacity referred to that of an equal weight of pure water. The **unit of heat** is the amount of heat required to raise the temperature of a unit weight of water one degree. Therefore, the specific heat of a substance being referred to water expresses the heat units requird to raise the temperature of a unit weight of the substance one degree.

The **specific heat of a solid** or liquid always refers to the heat per unit weight. The **specific heat of a gas** may be referred to the unit weight or unit volume, as desired. The specific heat of air and gases is different according as the air or gas is confined (constant volume) or is allowed to expand (constant pressure). The specific heat of a gas for "equal volumes" is the heat capacity of the gas referred to that of an equal volume of air at the same temperature and pressure.

The Coal Age Pocket Book

The following table gives the specific heats of a few of the common solids and liquids of interest in mining:

SPECIFIC HEATS OF SOLIDS AND LIQUIDS

Substance	Temperature, Deg. Fahr.	Specific Heat
Aluminum	60-1150	0.2145-0.3077
Copper	32-1650	0.0933-0.1259
Iron	32-1100	0.1050-0.1989
Lead	60- 600	0.0299-0.0338
Lead (melting point 610° F.)	610- 680	0.0356-0.0410
Mercury	32- 500	0.0334-0.0320
Platinum	60- 210	0.0324
Silver	32-1200	0.0559-0.0750
Tin	32- 210	0.0545
Zinc	32- 700	0.0935-0.1220

The specific heat of all substances varies more or less with the temperature as appears in the above table. In the case of gases, the increase per degree (Fahr.) above zero is roughly estimated as follows: Air, nitrogen, carbon monoxide, 0.000012; oxygen, 0.00001; carbon dioxide, 0.00006; hydrogen, 0.0002; and water vapor, 0.0001; etc.

The following table gives the specific heats of the common mine gases, for equal weights at constant pressure and constant volume, and for equal volumes under constant pressure:

SPECIFIC HEATS OF AIR, MINE GASES AND VAPORS

Substance	Equal Weights Const. Pres.	Equal Weights Const. Vol.	Equal Volumes Const. Pres.
Air	0.2374	0.1689	0.2374
Methane	0.5929	0.4219	0.3314
Olefiant gas	0.4040	0.2875	0.3951
Carbon monoxide	0.2450	0.1743	0.2369
Carbon dioxide	0.2163	0.1539	0.3307
Hydrogen sulphide	0.2432	0.1731	0.2897
Oxygen	0.2175	0.1548	0.2405
Nitrogen	0.2438	0.1735	0.2368
Hydrogen	3.4090	2.4260	0.2361
Water vapor	0.4805	0.3419	0.2996
Ammonia	0.5080	0.3615	0.2992

When gas, air or vapor is free to expand (constant pressure) heat is absorbed and becomes latent. For this reason more heat is required to produce the same rise of temperature when expansion occurs than when the volume remains constant, and the specific heats in the first column are therefore higher than those in the second column of the table given above.

The values given in the first column of this table have been determined by experiment directly, while those in the second column have been derived from the first by dividing the latter by 1.405, the ratio of the specific heat of gases at constant pressure to that at constant volume. Likewise, the values given in the third column have been derived from those in the first by multiplying the latter by the specific gravity of the gas or vapor referred to air.

Inquiries of General Interest

Laws Regulating Explosives

I want to ask if there are any laws regulating the manufacture, sale and use of explosives, other than the state laws, in Pennsylvania. I am particularly interested in ascertaining if there is any law that defines the minimum distance at which a magazine for the storage of explosives may be located from inhabited dwellings, public roads, etc., similar to the provisions made in this respect in the laws of Massachusetts.

Sim. C. Reynolds, Safety Inspector,
Aetna Life Insurance Co.

Houston, Penn.

The following reply to this question has been sent by Arthur L. H. Street, Attorney and Counsellor at Law, St. Paul, Minn.

Aside from state laws, the only regulations on this subject will probably be found in the ordinances of cities and towns. For instance, on April 2, 1901, an ordinance was adopted in Philadelphia, Penn., regulating the manufacture, sale, storage and use of high explosives within the city, by requiring licenses to be obtained from the mayor, and prohibiting the keeping of such explosives within 300 feet of churches, schools, public buildings, etc. Similar ordinances have been enacted in most of the cities of the country. For information concerning these local regulations inquiry should be sent to the clerk of the city in or near which it is desired to store or use explosives.

Interchange of Certificates of Competency

We have had considerable discussion recently on the question as to whether a mine manager's (mine foreman's) certificate issued by the examining board in Illinois will be accepted for a similar position at any place in Canada or whether any of the certificates of competency issued by the examining boards in any of the states are good in any of the provinces of Canada? Kindly state which, if any, of the Canadian provinces will accept of such certificates and from what states they must come, and to whom application must be made.

John McMillan.

Gillespie, Ill.

The only province in Canada that, to our knowledge, recognizes a certificate of competency granted in another state or country is the Province of Alberta. The third paragraph of chap. 4, sec. 21, of the Alberta mining laws reads as follows:

> The chief inspector of mines may sign and deliver a certificate, without examination, to any person holding a certificate from any other country, providing the board of examiners reports that the standard of training and examination required for the granting of such certificate is equivalent to that required for the granting of a corresponding certificate under this act.

This law went into effect August, 1913. It applies alike to all the states where examinations are held and certificates issued by the state examining board. But the standard of such examination must be judged by the examining board of Alberta and its decision accepted as final. We believe that the standard of requirements for a mine-manager's (mine-foreman's) certificate in Illinois is fully equal to the requirements in Alberta and that the holder of such a certificate in Illinois would be indorsed as competent to hold a similar position in that province, upon making application to the chief mine inspector of Alberta.

Effect of Poor Ventilation on Safety-Lamp Flame

In a heading in a mine where the ventilation is very poor, but where there is no gas, either carbon dioxide (CO_2) or marsh gas (CH_4), being generated or that can be detected, what effect if any would be observable on the flame of a safety lamp owing to the slack ventilation? The gob in this place is somewhat heated.

Fireboss.

——, Penn.

In answering this question it is necessary to consider carefully the effect the slack ventilation, together with the heated condition of the gob, will have on the mine air in the place. The heating of the gob indicates the slow combustion of the fine coal in the waste. This combustion occurring in a slack air current in a confined space undoubtedly consumes considerable of the oxygen of the air, which is thus somewhat depleted of its oxygen content. In addition to this, it is possible that there is a slight amount of carbon monoxide present, produced by the combustion in a limited supply of air. The percentage of this gas, however, is probably inappreciable as long as some air is moving in the place.

The effect on the flame of a lamp burning in air partly depleted of its oxygen is to lengthen the flame of the lamp, which in its endeavor to obtain the necessary oxygen for its combustion reaches upward in a slim, taper-like blaze. The presence of carbon monoxide in the air, even though the amount is inappreciable, helps to lengthen the flame of the lamp. This effect would be much less if there was any carbon dioxide present. The latter gas being extinctive in its effect on flame would act to reduce the size of the flame and counteract the effect just described as due to the depletion of the oxygen and the possible presence of carbon monoxide.

It is a matter of common experience to observe this reaching upward of the flame of a common open light in a place void of proper ventilation, especially where there are evidences that slow combustion is taking place in the gob. This effect has been described, in earlier textbooks of mining, as due wholly to the presence of carbon monoxide, which is assumed to be present in the air owing to the combustion going on in a limited air supply.

Examination Questions

Montana Mine Foremen's and Firebosses' Examination Held at Red Lodge, June 8-10, 1915

(*Selected Questions*)

Ques.—Of what is atmospheric air composed?

Ans.—Normal atmospheric air is composed chiefly of a mechanical mixture of nitrogen and oxygen gases, together with smaller quantities of carbon dioxide, water vapor, argon and traces of ammonia. Its composition is practically as follows: By volume, oxygen, 20.9 per cent.; nitrogen, 79.1 per cent. By weight, oxygen, 23 per cent.; nitrogen, 77 per cent. The carbon dioxide (CO_2) in normal air, is generally stated as four parts in 10,000 or 0.04 per cent.

Ques.—Give the names, chemical symbols and composition of the different gases met with in coal mines.

Ans.—The common mine gases are the following:

Methane or marsh gas (CH_4); composition, carbon one atom; hydrogen, four atoms.

Ethene or olefiant gas (C_2H_4); composition, carbon, two atoms; hydrogen, four atoms.

Ethane (C_2H_6): composition, carbon, two atoms; hydrogen, six atoms.

Carbon monoxide (CO): composition, carbon one atom; oxygen, one atom.

Carbon dioxide (CO_2): composition, carbon, one atom; oxygen, two atoms.

Hydrogen sulphide (H_2S): composition, hydrogen, two atoms; sulphur, one atom.

Besides these may be mentioned the elementary gasses forming the atmosphere, oxygen (O) and nitrogen (N); and hydrogen (H), which enters into the composition of so many of the mine gases, although not ordinarily found as a free gas in mines.

Ques.—What noxious gases are produced by fires and explosions of firedamp in mines?

Ans.—The combustion incident to a fire or explosion of firedamp consumes much of the oxygen of the mine air, and as a result the products of such combustion may be stated as follows: Carbon dioxide (CO_2); carbon monoxide (CO); water vapor (H_2O); nitrogen (N_2). The relative amounts of carbon dioxide and carbon monoxide produced will depend on the available oxygen present to support the combustion. In a limited supply of air (oxygen) the combustion is more or less incomplete, and a less quantity of carbon dioxide and a greater quantity of carbon monoxide are produced, besides a larger relative proportion of nitrogen. Frequently, also, variable amounts of unburned methane (CH_4) and hydrogen (H_2) and at times small quantities of olefiant gas (C_2H_4) are found.

Ques.—Describe the dangers attending the presence of gases met with in coal mines.

Ans.—The presence of the gases in mine air dilutes the air and thus reduces the proportion of oxygen, which is necessary to support life and maintain healthful conditions in the mine. Some of these gases, as carbon monoxide (CO) and sulphureted hydrogen (H_2S) are extremely poisonous in their effect on the human system. Carbon dioxide also has a toxic effect on the system. Other gases when present in sufficient quantities produce suffocation, although not poisonous in their action on the system. This is the case with the hydrocarbon gases and nitrogen. Others of the mine gases are combustile and form inflammable or explosive mixtures with the mine air. The inflammable and explosive gases are: Methane (CH_4); carbon monoxide (CO); and hydrogen sulphide (H_2S).

Ques.—How are mine gases detected?

Ans.—Briefly, methane and carbon dioxide are detected in mines by the effect they produce on the lamp flame. In the detection of methane, a safety lamp must be used to avoid the ignition of the gas. Pure methane unmixed with air or containing but a small proportion of air may extinguish the flame of the lamp. When the proportion of air and gas is such that the mixture is inflammable, the volume of the flame is enlarged and it has an unsteady motion. With larger proportions of air or a smaller percentage of gas, a flame cap is observed surmounting the lamp flame. This is caused by the burning of the gas present in the air and in contact with the flame.

Carbon dioxide dims the flame of a lamp and when present in larger proportions extinguishes the flame completely.

Carbon monoxide being extremely poisonous and deadly in its effect, when present in air in too small a proportion to produce an appreciable effect on the flame must be detected by observing its effect on small animals, such as birds and mice, which are prostrated in a much shorter time than is required to produce a like effect on persons.

Hydrogen sulphide, though seldom present in sufficient quantity in mine workings, is best detected by its disagreeable odor, which resembles that of rotten eggs.

Ques.—How many cubic feet of air would be necessary to dilute and render harmless 500 cu.ft. of marsh gas (CH_4)?

Ans.—The answer to this question depends on the condition of the mine both with respect to dust and the inflammable nature of the coal. Where the mine is dusty and the coal inflammable the proportion of gas should not exceed 1 per cent. and may often be required to be much less than this to secure the safety of the mine and the men employed therein. Where the coal is harder, and there is less fine dust formed in the workings, the percentage of gas may safely reach 2 per cent.

But assuming a 1-per cent. limit for the gas, the total circulation (air and gas) would be, in this case, $500 \div 0.01 = 50{,}000$ cu.ft. per min. when the mine is generating 500 cu.ft. per min. The volume of air required to *dilute* 500 cu.ft. of marsh gas, under these conditions, would be $50{,}000 - 500 = 49{,}500$ cu.ft. of air.

Coal and Coke News

Washington, D. C.

Secretary Lane of the Interior Department after exhaustive hearings attended by the various disputants in the Oklahoma oil land lease matter, on June 17 announced his decision in the question of the socalled Foster lease covering 680,000 acres in the Osage Indian reservation which will expire on Mar. 16, 1916. The Foster lease is now owned by the Indian Territory Illuminating Oil Co. which has subleased the oil lands to a number of producers.

The Indian Territory Illuminating Oil Co. is to be eliminated as an intermediary and the sublessees are to lease direct. Oil and gas rights are to be leased separately and for terms of five years from date of approval by the Secretary of the Interior and as much longer thereafter as oil is found in paying quantities but the term shall not extend beyond the time the title to the minerals remains in the Osage Indian tribe.

Sublessees now holding land under the Foster lease will be given an opportunity to lease direct subject to the 4800 acre limitation of the law. Quarter section units, however, which are capable of producing 25 bbl. or more a day July 1, 1915, will be withheld and with the land not taken up by the sublessees will be offered for lease at public auction under rules to be prescribed by the Secretary of the Interior.

All oil leases will provide that the government may have an option to purchase all oil produced at the highest posted market price on the day of sale. Leases will be made on a royalty of one-sixth of the production, except where the wells in any quarter section shall produce 100 bbl. a day for a calendar month period, when the royalty will be one-fifth.

Unless lands are developed within one year after the approval of a lease by the Secretary of the Interior, the lessees shall pay $1 an acre a year. The plan provides for the making of gas leases to the present gas lessees for such periods as the Secretary of the Interior may determine, at a royalty of one-sixth, and provides that all contracts for the sale or use of gas shall be subject to the Secretary' approval.

The present oil sublessees must file their acceptance of the new terms before Aug. 1, 1915, and after that date all land open will be offered to the highest bidder.

Government Wins Favorable Decision

It was announced on June 21 that the Supreme Court of the United States had handed down a decision in the case of the United States against the Delaware, Lackawanna & Western Ry. Co., favorable to the contentions of the government. The suit was brought in connection with the socalled commodities clause of the interstate commerce act. This provision, it was claimed, was being violated by the plan of selling coal at the mine mouth to a coal company which disposed of the product and subsequently shipped it over the road.

It was originally contended that an exclusive contract of this kind was monopolistic and hence against the law. The district court for New Jersey had rendered a previous decision dismissing the suit. The question at issue necessarily turned chiefly about the legality of the plan for disposing of the coal. The text of the decision in the case will be made available within a few days, and will afford full information regarding the grounds upon which the verdict has been prepared and rendered.

PENNSYLVANIA

Anthracite

Pottsville—With the new Dawson coal tax act now effective rumors are already heard of suits on the part of municipalities and townships in this county which do not actually produce coal, but are desirous of sharing in the proceeds of the tax as they were entitled to do under the Roney act of two years ago. The question has arisen as to whether this city will receive a sufficient proportion of the tax to make it of consequence to the finances of the community. The whole trouble arises from the fact that the new law specifically states that the tax shall be apportioned to the districts in which the coal is mined and this will shut out a majority of the towns and townships in the county from a participation in the tax proceeds.

Pittston—No. 5 shaft team will represent the South Pittston district of the Pennsylvania Coal Co. in the annual intercompany first aid contests at Inkerman in September. The team made the average of 95 per cent. in the district elimination contests. Peter Hoolihan, of No. 5 team, is the district's entrant in the one-man contest.

Shamokin—The collieries of the Lehigh Valley Coal Co. will be idle on Aug. 21, since that is the date which has been selected for the annual outing of the Social Association of Lehigh Valley Employees. The outing this year will be held at Edgewood Park, Shamokin, instead of at Hazle Park, Hazleton. A special train will be run from Pittston and Wilkes-Barre to Shamokin. Salaried employees of the Lehigh Valley Coal Co. compose the Social Association.

Wilkes-Barre—A section in the central portion of Parsons about half an acre in extent recently settled about 20 ft. in a mine cave, occurring over an abandoned working of the Delaware & Hudson Co. A storehouse and a garage together with several other buildings dropped into the opening. Steps were immediately taken to prevent further caving.

Bituminous

Clearfield—Despite reports to the contrary, officials of the Sommerville Coal Co., which has large operations in this vicinity, have denied the story to the effect that it intended opening up large coal fields at Gazzam, and putting in an extension on the New York Central for the purpose. It was explained that the company had been prospecting in and around Gazzam but had found the field wanting.

Connellsville—The production of coke from the Connellsville region recently attained 334,000 tons per week with shipments of approximately 332,000 tons. This was an increase of 20,000 tons in production and 11,000 tons in shipments over the previous week. The steel interests are operating about 72 per cent. of their ovens in the Connellsville region.

One thousand additional coke ovens have been fired in this territory by the H. C. Frick Coke Co. The starting of these ovens means employment for many more men. With a total of 19,224 ovens the Frick company has now 12,895 in operation.

Uniontown—Orders have been issued to have the Isabella mines of the Isabella-Connellsville Coke Co. in Fayette County near Uniontown, placed in operation at full capacity for the remainder of the year or until further orders. This plant has been completely closed since last June and the houses have been empty for that period. At this plant there are 260 ovens, 136 being of the rectangular type and 124 beehive ovens. The Isabella plant is one of the Kuhn properties, being owned by the same interests which own the West Penn traction and electric system. Sometime ago it went into a receivership.

Johnstown—Stockholders of the Greenwich Coal & Coke Co. which has extensive operations in Cambria, Blair, and Indiana Counties (Penn) have sanctioned a movement to take over the stock, consolidate the interests and change the name of the Tunnel Coaling Co., which has mines in Cambria County, the officers to remain as before the change. The Greenwich Coal & Coke Co. operations are working about 60 per cent. of capacity. There are nine mines in the three counties and only one, a small one, is closed. Work will be started shortly on the installation of a ventilating plant to replace the one at Yellow Run shaft at Dunlo, Cambria County.

Dawson—Announcement has been published stating that the Washington Coal & Coke Co. is sharing in the war orders for fuel placed in this country by brokers. The contract so far as could be learned from officials of the company calls for a delivery of 1500 tons daily for a year. The coal is being shipped to Baltimore and from there it is believed to be consigned to Italy. The producers state positively that they do not know where the coal is being shipped and care less. This company is now operating 700 of its 1000 coke ovens and maintaining its 70 per cent. capacity.

WEST VIRGINIA

Logan—President Cary, of the Lorain Coal & Dock Co., announces satisfactory progress in developing the large tract of land recently acquired in the Island Creek district in West

Virginia. A tipple containing five tracks has been constructed, and equipped to make any kind of coal desired. The production of the mine in June will likely be 10,000 tons and it is planned to double that output during July. In August it is expected to mine from 1000 to 1200 tons daily. The mine as well as the mining town has been named Lorado. It is located 24 miles southwest of Logan, the county seat of Logan County.

Huntington—The West Virginia Coal Association composed of coal operators has established offices on the 8th floor of the Robson-Pritchard Bldg. The suite comprises four rooms on the northeast side of the building. W. H. Cunningham and G. C. McIntosh are in charge of these offices.

Charleston—During the month of May, 22 miners were killed in the mines of West Virginia. Although this record is lower by 6 than that of May for 1914, during which 28 miners met their death, Chief Mine Inspector Earl A. Henry declares that his department is exerting every effort to reduce the fatalities. He has requested that each and every operator in the state coöperate with the department in using every possible means to reduce the number of accidents.

Bluefield—The coal tonnage from the Norfolk & Western field in the month of May not only made a record for the year 1915, but a record which has only been surpassed three times in the entire history of the field or during the months of July, August and September of 1914. The output for all the mines in the field in May was 2,434,614 tons, exceeding the tonnage for April by 234,063 tons. The heaviest tonnage ever handled by the Norfolk & Western was moved in September 1914, when 2,509,916 tons were transported. Shipments thus far in June are reported as heavy, and it is generally predicted that this month will prove the banner month in the field's entire history. The Virginian R.R. also made a considerable increase in its coal tonnage during the month of May, its business amounting to 352,750 tons as compared with 309,427 tons in April, showing a gain of 43,323 tons.

ALABAMA

Birmingham—The annual outing of the Alabama Coal Mine Officials under the auspices of the Alabama Coal Operators' Association, will be held at the Edgewater mines of the Tennessee Coal, Iron & R.R. Co., July 10. This outing will be in the nature of an Institute for the education and instruction of those invited; consequently the number of invitations will be limited to the capacity of the auditorium at Edgewater, and only the executive and operating officials of the Alabama Coal Operators' Association will be asked to attend the meeting.

KENTUCKY

Lexington—Coal interests here have been much interested by the announcement of the discovery of a new bed of coal in Bell County, Ky., when Capts. Gunn and Rennebaum were opening up a new mine at Logmont. This vein is described as being 6 ft. 11 in., in thickness, with no partings of any kind in the seam, which is of fine quality. It is reported to be high in heat content and low in ash and to be one of the richest veins opened in Bell County, if not the whole eastern section of the state.

Jenkins—The Consolidation Coal Co. recently put 200 extra miners to work in its plants in Jenkins and McRoberts. Beginning July 1, it will make another increase in the output. On that date it is said all the mines in the Elkhorn field will be running.

Frankfort—Ownership of 25,400 acres of coal and timber land in Perry County was settled by a suit recently decided in the Court of Appeals at Frankfort, the decision going to Thomas C. Millard and others in their suit against the Kypadel Coal & Lumber Co., the highest state court affirming the Perry Circuit Court.

Praise—The Eastern Kentucky Block Coal & Fuel Co. announces that the first shipments will be made over the Carolina, Clinchfield & Ohio railroad July 1, destined for the markets of the South Atlantic seacoast. It will ship 1000 tons daily until the work advances. Extensions and increases will then be made.

Fleming—The Elk Horn Coal Corporation recently started 200 extra miners to work in the plants around Fleming. A good increase in coal shipments will follow. There is much industrial activity all over the eastern Kentucky coal fields.

OHIO

Floodwood—The power plant erected at Floodwood, Ohio by the Southern Electric Producing Co. has three large generators installed with a capacity of 6000 kw. Contracts have been made with 10 operating coal companies in this vicinity to furnish power for mining and other contracts mill be made later on. In addition to the plant at Floodwood, the same syndicate has plants in other places as follows; the Hocking Power Co. at Nelsonville; the Mutual Electric Co. at Middleport and the Athens Electric Co. at Athens. Later on it is planned to operate all of the power plants under a holding company to be styled the Ohio Electric Secureties Co.

Columbus—Since the settlement of the strike in the eastern Ohio district there has been some question about the interpretation of Rule 7 of the Miners' scale. The question of the duties of the pit committee has been the subject of dispute on innumerable occasions so the joint committee representing the miners and operators agreed on the following interpretation of the rule: Rule 7. The pit committee shall be limited to not more than three (3) members, one or more of whom shall be able to speak the English language. They shall remain at their working places the same as all other employees unless a miner and a mine boss fail to agree on prices to be paid for extra work, when they may be called in to confer with the mine boss or superintendent to decide the dispute. This, however, shall not prevent the committee from looking after the proper interests pertaining to the miners' organization. The interpretation of the Joint Scale Committee of the last clause in Rule (7) is that it does not extend the privelege of the mine committee beyond the limitation of the rule, and shall not be construed to give it any authority to interfere with the operation of the mine or proper discipline of the men. The term "proper interests pertaining to the miners' organization" is understood to mean, looking after membership in the local union, check members, union dues, or serving as interpreter if called upon, and is held to apply exclusively to the internal affairs of the United Mine Workers.

A movement has been started, fostered by John H. Winder, general manager of the Sunday Creek Coal Co., for a stronger association of operators in the Hocking Valley and eventually in the whole state. It is hoped to produce out of the chaotic condition of the coal trade in Ohio, some semblance of order and methods, which will be beneficial to the coal trade generally. This movement is modeled after the organization recently formed called the Splint and Gas Coal Operator's Association of West Virginia.

Steubenville—One of the developments in the projects of the two Columbus coal concerns to prosecute stripping operations in Jefferson County, Ohio, along the line of the Wabash R.R. is a movement to have an injunction issued by the courts to stop operations before they are started. Some of the farmers in the neighborhood of the lands owned by the New Method Coal Co. and the Piney Fork Coal Co. claim that the stripping operations will ruin their farms.

Martins Ferry—The Florence mine of the Youghiogheny & Ohio Coal Co. near here recently resumed operation for the first time since the eastern Ohio strike was settled. Minor difficulties between operators and men prevented an earlier start. This mine employs approximately 300 men when running at full capacity.

It is predicted that within 30 days every coal mine in eastern Ohio will be working full time, and will continue to so work. At present 46 mines are working and 38 are idle in this sub-district, while a number of the idle mines are preparing to resume work.

INDIANA

Petersburg—The S. W. Little coal mines at Little, which have been idle for several weeks have resumed operation, employing 150 men.

Boonville—The miners employed at the Caledonian coal mine have organized a coöperative association and have taken over the mine property.

ILLINOIS

Champaign—The Illinois Miners' and Mechanics' Institute is conducting a short course in coal mining at the the University of Illinois, which is to continue until July 17. The course is particularly useful to those who desire to apply to the State Mining Board for certification to the position of state mine inspector, mine manager, mine examiner and hoisting engineer.

Staunton—Plans have been made for wrecking the De Camp mine soon. A force is now engaged in taking out material from underground, after which the top works will be dismantled.

Percy—The mines at Willisville have been closed down for about 60 days, throwing approximately 300 men out of work. At a recent meeting of the miners' union at Percy, it was decided to share up with the men at Willisville. Accordingly about 125 were given places in the mine.

ARKANSAS

Fort Smith—Sixty-eight defendants in the Bache-Denman coal syndicate suit for $1,250,000 damages for the destruction of property during the prairie Creek riot of one year ago, have recently filed a motion in the United States District Court to vacate the order for the appointment of a receiver for the syndicate which filed voluntary receivership proceedings following the riot.

IDAHO

Lewiston—The Brew Coal Co. has taken over the old Spring coal mine at Lewiston and will commence operations shortly.

FOREIGN NEWS

Nanaimo, B. C.—Four more bodies of miners, victims of an explosion in the mine of the Western Fuel Co. property, have been recovered. There were 22 deaths in all, the explosion occurring on May 28.

Crows Nest Pass, Alta.—The Corbin Coal & Coke Co., owned by D. C. Corbin, of Spokane, has been shut down for the summer, and the entire crew, excepting the men on the steam shovels, has been discharged. These men were retained for surface development work.

Hillcrest, Alta.—The mines of the Hillcrest Collieries, Ltd., at Hillcrest, Alta., were closed down on the 15th inst., the British miners refusing to work until 100 Austrians and Germans employed were discharged. The movement against alien enemies is spreading throughout the West, and trouble is expected at Frank Blairmore and other mining centers.

PERSONALS

E. W. Mansfield was recently appointed by Chief Mine Inspector Shiflett, as district inspector for Middle, Tennessee.

Richard Coulter was recently elected to the presidency of the Keystone Coal & Coke Co., of Greensburg, Penn., to fill the vacancy caused by the death of the late Lloyd C. House.

P. F. Mitchell, mine foreman at the E. F. Stackhouse colliery, Shickshinny, Penn., has gone to Lake Kathlyn, British Columbia, where he will superintend the opening of an anthracite mine.

Cadwallader Evans recently resigned his position as general manager of the Arcadia Coal Co., Ltd., of Stellarton, N. S., and his present address is the Union Oil Bldg., Los Angeles, Calif. Mr. Evans is at present taking a needed rest.

Charles Fox, formerly secretary-treasurer of the United Mine Workers of America, district 11, and now president of the Indiana State Federation of Labor is to be one of the deputy mine inspectors under Michael Scollard, the new state mine inspector.

John Zelenka, secretary of the Pittsburgh Vein Operators of Ohio, with headquarters at Wheeling, W. Va., was recently reëlected at a meeting of the association. W. R. Woodford, president, S. H. Robbins, vice-president, and C. W. Troll, treasurer, were reëlected at the same meeting.

E. W. Stone, federal receiver for the Wyoming Coal Mining Co. since June 25, 1914, has been discharged by the federal court at Cheyenne and the property returned to the company. All outstanding indebtedness is to be paid in full. The company is one of the largest operators in the Sheridan field and owns property valued at about a million dollars.

E. C. Roberts, Jr., has formally resigned his position as resident manager of the Fairmount Coal Co.'s mines, since enlisting in the Canadian Contingent of the British Army. He goes as an officer and swears allegiance to the King only during service. This permits him to resign at any time without prejudice to him in any way. He is now at the camp in Niagara-on-the-Lake.

OBITUARY

Edwin E. Randall, aged 55 years, formerly superintendent of the Schooley mine of the Pennsylvania Coal Co. at Wyoming, Penn., died recently at Dayton, Tex., where he was employed by the New York Construction Co.

Captain George Ormrod died in Allentown, Penn., June 21, of heart disease at the age of 76 pears. He was born in Preston, England, coming to America when 20 years old. Captain Ormrod became a coal operator and was located at Raven Run during the "Molly Maguire" trouble in the '70s. For years past he has been head of the Donaldson Iron Works and vice-president of the Lehigh Portland Cement Co. Captain Ormrod was a member of the Franklin Institute and the American Institute of Mining Engineers. He is survived by five children.

Patrick Clark of Spokane, a well-known western mining man, died rather suddenly recently at the age of 65. He learned his trade as a coal miner in Scotland, emigrated to the States, worked in the Hoosac tunnel, on the Comstock lode, sank the first shaft on the Anaconda and discovered it was a copper and not a silver mine. He built the first plant for milling the galena ores of the Cour d'Alenes and discovered and at one time owned the famous War Eagle Mine at Rossland which has produced $30,000,000 in gold and is still producing $3,000,000 a year.

TRADE CATALOGS

The United Lead Co., 111 Broadway, New York. "Ulcoloy." Eleven pages, 3½x6 in., unillustrated.

INDUSTRIAL NEWS

Louisville, Ky.—The St. Bernard Mining Co. and the Jellico-Laurel Coal Agency have been elected to membership in the Louisville Board of Trade.

Cleveland, Ohio—The M. K. Powers Advertising Co., recently changed its name to the Powers-House Co. The present address of this firm is 724-725 Illuminating Bldg., Cleveland, Ohio.

Marshfield, Ore.—Another coal field to compete in the outside market in the near future is in the Willamette Valley of Washington. The completion of a railroad from this point will make this new field accessable.

Hazard, Ky.—Work is being pushed on the First Creek Branch of the Lexington & Eastern R.R. into a rich coal territory below here. The road will be completed within 30 days when mining activities will be started.

Ebensburg, Penn.—Mine No. 20 of the Pennsylvania Coal & Coke Corporation at Hastings, one of the oldest operations in that region, has been taken over by the Rich Hill Coal Co., whose plant is nearby. A number of needed repairs are planned and the mine will be closed down for some time, that these repairs may be properly made.

Birmingham, Ala.—A $45,000 mortgage has been given by the Eldorado Coal Co. of Birmingham to the American Trust and Savings Bank. The mortgage is to secure the issue of 45 bonds of $1000 each, payable in 1920. The Indio Coal Co. has given mortgage to the American Trust and Savings Bank for $69,000 at 6% to secure the issue of bonds to that amount.

Portsmouth, Ohio—With the settlement in the Probate Court in Scioto County of the last two condemnation proceedings, the Chesapeake & Ohio Northern Ry. Co. has an unbroken right of way from the Ohio River to the Pike County line through Scioto County. The work of constructing the roadbed for the new line through the county is being rushed.

San Francisco, Calif.—The Ingersoll-Rand Co., recently opened a branch office at 139 Townsend St., San Francisco, with a view to giving closer attention to present and prospective customers than it was possible to secure through an agency. H. L. Terwilliger is district manager for the San Francisco and Los Angeles offices, with headquarters in San Francisco.

Mobile, Ala.—In order to put the port of Mobile on an equal footing with other ports on the Atlantic coast in handling bunker coal, the Mobile Bar Pilots Association has reduced rates for vessels coming into port only for coal, to a sum equal to those prevailing on the Atlantic coast although the service rendered is considerably greater. This is the result of the opening of the Warrior River.

Columbus, Ohio—Affirming the Franklin County appellate court and reversing the Common Pleas Court, the Supreme Court remanded for new trial the suit won by the New York Coal Co. in the common pleas court for $4600 claimed to be a balance due it from the Sunday Creek Coal Co. and the Buckeye Coal & Ry. Co. on minimum royalties for coal taken from mines leased to them in 1906 to 1908.

Duluth, Minn.—Coal shipments to Duluth and Superior from Lower Lake ports, from the opening of navigation up to June 1, amounted to 1,057,589 tons, being a decrease of 449,652 tons from the amount handled during the corresponding period of 1914. Duluth's soft coal receipts in May, amounted to 251,193 tons, or just about half the tonnage received at Superior. Of anthracite, Duluth received 41,756 tons, while Superior received 208,733 tons.

Montgomery, W. Va.—The May loadings of coal and coke on the Chesapeake & Ohio R.R. amounted to 2,025,620 tons. For the same month of 1913 these loadings were 1,812,500 tons. The loadings for January and February of the current year were in excess of the loadings for the same months in 1914. March, however, showed a decrease of something over 100,000 tons, and April a decrease of 99,000 tons. The first five months of the year, however, showed an increase over the same months of 1914, of 250,000 tons.

Huntington, W. V.—The Federal Mine Rescue Department has established a sub-station in the 3rd story of the Federal Building where H. D. Jones will be permanently in charge. The establishment of the station follows the announcement made early in May to the effect that Mine Rescue Car No. 8 would have headquarters in Huntington. In cases of accident at the mines, application for use of the car will come to the Huntington sub-station. D. J. Parker will be in charge of mine rescue car No. 8 stationed here.

Philadelphia, Penn.—The Pennsylvania R.R. has been adjudged not guilty in the suit brought against it by the government before the local Federal Court, on the charge that it granted rebates of 10c. per ton to the Glen White Coal & Lumber Co., of Kittanning Point, Penn., in the Clearfield bituminous coal district. The verdict was gained largely through the statement that the payments were made for services rendered by the coal company in hauling coal from its mine to the Pennsylvania tracks, a distance of 9000 ft.

Harrisburg, Penn.—Governor Brumbaugh recently announced his approval to the Vare resolution providing for the appointment of a commission of three to investigate the cause of the increase in the price of anthracite coal by operators or dealers, whether justified or made as a result of "any illegal combination or confederation upon the part of the operators of anthracite coal mines or dealers in anthracite." The commissioners are to serve without compensation and are given the right of subpoena. The commission has $5000 for expenses and may employ a secretary and call upon the Attorney-General for advice.

Toledo, Ohio—The Toledo Furnace Co. recently broke ground for a coke plant to be built on the company property adjoining the blast furnaces on the river front on the East Side. The general contract was let to the H. Koppers Co., of Pittsburgh, which already has its temporary construction office on the grounds. It is the present plan to build two batteries of coke ovens. The coke and gas manufactured will be used by the furnace company itself. West Virginia coal will be largely used according to published statements. Nearly 500 men will be employed in the construction work. This concern has in the past purchased its coke from Pennsylvania ovens.

Huntington, W. Va.—It is believed that the coal tonnage for the Grand Central Division of the Chesapeake & Ohio R.R. will, during the month of June, surpass all previous records for that month in the history of the company. Up until the 15th of the month, there had been moved 913,545 tons of coal or an increase over the same period of last year of 25,205 tons. It is estimated that over 2,000,000 tons of coal will be moved during June. During the month of May this division established a record in moving coal amounting to 2,044,675 tons. It is stated that the mining of coal has been heavy during the past month, and that the mines in this and neighboring states are operating to capacity.

Washington, D. C.—Modification of the anthracite coal rate to tidewater and the financial separation of carriers from coal companies controlled by railroads are two of the recommendations contained in the decision of the Interstate Commerce Commission, soon to be rendered. An investigation of the rates and regulations of the common carriers governing the transportation of anthracite coal from producing fields to tidewater and official territory, was instituted by the Commission on its own initiative in June 1912. The purpose of the inquiry was not only to determine the reasonableness of the rate, but whether the roads should be allowed to control mining companies. The rates on coal to tidewater are held to be too high, and a slight reduction will be enforced.

Cincinnati, Ohio—The United States District Court has heard and taken under advisement the bill of complaint brought by John S. Jones, of Chicago, seeking to compel the Hocking Valley Ry. Co. and others to turn over to him the capital stock of the Buckeye Coal & Ry. Co. and the Ohio Land & Ry. Co., which he alleges is withheld by the defendants in defiance of the decree of the court handed down in the Government's "soft coal trust" case. The point at issue is whether the stock of the two companies mentioned was to be disposed of under the decree of the court, the railway companies maintaining that it was not covered by the decree. The Government is watching the case, presumably with a view to instituting contempt proceedings if it developes that the decree of the court has been violated.

Spokane, Wash.—The third coal claim in the history of Alaska has just been allowed to go to patent, according to information received at Spokane. This claim is owned by the estate of Mary A. Rosene and was recommended for a patent by the office at Juneau. Familiarly known as the Blaine claim, it is located in the Bering River coal field and is accessable by water up the Bering River. It contains a bed of high-grade bituminous coal 17 ft. thick, running diagonally across the claim.

A striking feature of this allowance is that the Blaine claim is the only one out of 45 on the east shore of Bering Lake, a distance of 12 miles from Katalla over the mountains, to be allowed. Fourty-four claims, known as the Green-Young group and the Young-Ivey group were ruled on adversely. The Blaine claim lies adjoining the claim of M. A. Arnold of Seattle, which was allowed recently.

Coal Trade Reviews

General Review

Anthracite slow in responding to low prices and the usual summer dullness prevails. Reaction in bituminous though heavy exports stiffen up the sellers. Lake trade improves very slowly.

The anthracite trade is in the grip of the customary summer's dullness, somewhat accentuated and prematurely at hand. There are still some June orders to be shipped, but the trade failed utterly to show the usual month's end spurt, and there is little business in sight for July. Consumers are only making a feeble response to the heavy cuts offered by the individual operators, though this may be accounted for in a measure by a desire on the part of the buyers to strengthen their position with the large companies so they will be assured greater consideration in event of serious labor troubles on Apr. 1 next. The question of credits also continues a potent factor, many consumers being anxious to take supplies but only on such terms that the sellers do not feel able to meet.

There is more pressure to move bituminous coal; a reaction from the recent trend toward better conditions has developed and the price situation is not so encouraging. Quick buyers are able to pick up bargains, and low prices are the rule where any considerable block of coal is negotiated. Pressure is in evidence to move tonnage and the accumulation at Hampton Roads has reached a point where the railroads have been compelled to put temporary embargoes in effect.

The tremendous expansion in the export trade continues to exert a compelling influence on the market, and is undoubtedly stiffening the position of sellers. Additional inquiries are being received almost daily, but on the other hand a further advance in ocean freights is having a restraining influence on a further expansion in this direction. A curious development in the offshore trade is the arrival of a great many transatlantic liners on this side coaled up to their full capacity in spite of the extraordinarily high prices in Europe, and the correspondingly low prices here.

The inactivity among Ohio manufacturers, the disposition on the part of buyers to delay stocking because of the probability of continued low prices, and the fact that production can be enormously increased at any time, are depressing factors that are combining to keep the market in an extraordinarily depressed condition. Some boats are being loaded in the Lake trade, and shipments are increasing very slowly though the movement does not compare with previous seasons in any way. A congested condition is still reported at the Upper Lake docks.

Middle Western operators have apparently stiffened in their position as regards prices and are no longer anxious to contract at the prevailing low level. The coming threshing demand is a potent factor in the situation, and with generally record breaking crop reports in all sections there is a feeling of optimism in coal circles. Prices as a rule are at a fairly profitable level, though screenings are a trifle easier. The working schedules at the Southern Illinois mines are somewhat improved.

A Year Ago—Anthracite rounds out the month in better form than anticipated. Eastern bituminous markets at the lowest point for a long time. Situation at interior centers slightly improved under the influence of the large crops and the long suspension in Ohio.

BUSINESS OPINIONS

War Orders—The "Journal of Commerce" places the value of war orders, actual and expected, at $1,500,000,000 as follows: Great Britain, $500,000,000; Russia, $500,000,000; France $400,000,000, and Italy, $100,000,000. Of the total about one-third represents iron and steel products and base metals. The orders placed last week were largely for the Russian government. A feature of the contracts made recently is that they represent such items as locomotives, rails and structural material in rather larger degree than munitions of war.

Metal Markets—Shipbuilding work is active, most of the large yards on the Atlantic Coast having all the business they can take care of for the present. The activity of foreign buyers in the last fortnight has been displayed chiefly in inquiries and orders for railway equipment. Russia has ordered both locomotives and cars. France has placed an order for locomotives. Pig iron has an upward tendency and an advance was made in the price of bars and shapes to $1.25, when in reality this advance was only scheduled for July 1. The implement manufacturers have been exceedingly busy. An easing off in the price of spelter has helped the galvanizers somewhat, but many of them were practically out of the market for spelter, and they were refusing to make any quotations whatsoever for galvanized products.

Boston News Bureau—One of the peculiar features of the situation is the hesitation so noticeable in the many departments of business life. Outside of war orders there is a disposition to go slow on new commitments. The huge English and French war loans, if successful, means much. They will be a big factor not only abroad, but here. We should gain much by them in increased orders for breadstuffs and war munitions. From a money point of view this country is in a remarkably strong position. We can not only finance ourselves but can be a generous lender to Europe. Possibly conditions will change materially with the arrival of the German reply to President Wilson's second note. The outlook should be clearer after that.

Northwestern's Corp Report—Weather was cold and wet over the entire territory; crops generally are two weeks late, but the lateness may not be unfavorable. The making of the corn crop depends on the weather during July, August and September. Small grain is in excellent condition.

Bradstreet—A mixed budget of news is in evidence this week. Weather irregularities over a wide area have restricted current distribution of seasonable goods, while excessive moisture in the surplus grain producing states has retarded harvesting or crop growth, and pending the outcome of international political matters, some interests prefer to work along conservative lines. On the other hand, industrial operations continue to expand.

Marshall Field & Co.—Wholesale and retail distribution of dry goods shows unseasonable volume owing to the continued cool weather. Sales for future delivery by our traveling representatives are slightly ahead of those of the corresponding week a year ago. Fewer retailers have visited the market than during the same period last year. Collections are fair.

Duns—Nothing has occurred to check progress or to dim the bright future outlook. Prominence given to Europe's purchases of war materials overshadows the trend of affairs in strictly domestic channels, but there is still a gradual expansion in home consumption, and evidence of a less cautious policy in anticipating forward requirements. Recent official promise of abundant grain harvests has done much to stimulate confidence anew, and reports from the leading centers reflect an increasingly optimistic sentiment and more uniformity as regards actual business improvement.

ATLANTIC SEABOARD

BOSTON

Market quiet again and prices recede. Virtual embargo against some of the West Virginia output. Pennsylvania grades compete closely for business. Water freights quiet. Dull outlook for July anthracite.

Bituminous—The market on Pocahontas and New River is again extremely quiet. Although until recently the trend was encouraging it is now realized that the price situation is none too good. When any considerable block of coal is placed there are rumors of low prices and such sales as are reported undoubtedly reflect others that are on a like basis. The fact is the West Virginia operators are, as usual, showing their inability to work harmoniously and the output is too great for the market to absorb.

The demand for shipments inland is only spasmodic. Stocks are generally up to maximum and most buyers wait for price inducements. Cargoes for these points move very hard, and all-rail trade is also dull.

The railroads running to Hampton Roads appear to be taking a hand in the situation, to the extent of declaring what amounts to an embargo against shippers who fail to release cars in reasonably good time. This drastic remedy is made necessary by the big accumulations at the piers.

Georges Creek coals are not in any more plentiful supply. The slow movement of barges the past fortnight has simply helped out the detention at Baltimore; had they moved better they would have had longer waits at the loading piers.

Water Freights are again as quiet as the coal market. The demand falls off, and the slow movement of boats is not so much noticed. The Reading barge rate on bituminous from Philadelphia continues at 80c. to Boston points, notwithstanding a general expectation it would be reduced 5@10c. by the middle of June. Desirable transportation for the shoaler points is still in fair request.

Anthracite—The hard-coal market is almost featureless. There are still some unshipped orders for June, but for July there is little in sight. The July 4 suspension will be in effect soon, however, and with mining so close-hauled there is small likelihood of weak prices—at least not on the part of the principal companies. Meanwhile New England retailers are putting out very little coal.

Current quotations on bituminous at wholesale are about as follows:

	Clearfields	Cambrias Somersets	Georges Creek	Pocahontas New River
Mines*	$0.85@1.40	$1.20@1.60	$1.67@1.77	
Philadelphia*	2.10@2.65	2.45@2.85	2.92@3.02	
New York*	2.40@2.95	2.75@3.15	3.22@3.32	
Baltimore*	....	....	2.85@2.95	
Hampton Roads*	....	....	....	$2.65@2.80
Boston†	....	....	....	3.60@3.78
Providence†	....	....	....	3.50@3.73

* F.o.b. †On cars.

PHILADELPHIA

Anthracite continues dull, with collieries on half time and prices off circular. Bituminous very quiet, but some operators feel a change for the better is soon due, especially on Tide shipments.

Anthracite—Low prices and a dull market have been the ruling conditions the past week. Very few orders are coming in, as most of the dealers have filled all their winter storage orders. They state their customers offer plenty of orders but don't want to pay until fall. The summer dullness is evidently more apparent with the retail men than usual, as two quite prominent dealers have laid off men, a thing which they have not done in years past.

Cheap coal continues the rule. One dealer informed a representative of one of the large producing companies that he positively was not in the market for any first class coal; the only orders he had to fill were those for institutions and that he intended to go into the open market for bargains to take care of that trade. This seems to be the general practice among a number of dealers on orders of this nature, quality being only a secondary consideration on account of the low price at which they are taken.

Pea coal continues subject to the heaviest cutting. The circular is hardly thought of. One of the large companies is offering blocks of a thousand tons of this size at $1.85, without tax, freight prepaid. Most dealers claim they can buy good pea in any quantity at $1.60. Others yet say they have bought at $1.50, although it is not likely that any considerable quantity is moving at this latter price—yet.

Stove continues to hold closer to the circular than any of the other sizes; but there is not the least doubt that even this grade can be bought at the April circular, the usual conditions being, however, in this event that the other sizes must go with it to get the April price.

The retail price war in West Philadelphia and Kensington districts continues, although little coal is moving, as the class of trade in these sections usually buys only as needed.

The circular prices are as follows:

	City	Tide		City	Tide
Broken	$3.20	$4.45	Pea	$2.50	$3.25
Egg	3.45	4.70	Buckwheat	1.25	2.25
Stove	3.70	4.70	Rice	0.85	1.75
Chestnut	3.85	4.95	Barley	0.50	1.50

Bituminous—The situation is not materially different from last week, although among quite a number of interests the opinion is that a change for the better is due shortly, particularly as the iron and steel business continues to show increased activity. There are also fairly good inquiries for foreign deliveries, due to a stiffening by the British Government of the restrictions against coal exports, and this probably accounts for the fact that the exports the past week showed a slight increase over the preceding period.

Prices rule about as follows:

Georges Creek Big Vein	$1.65@1.75	Fairmont gas lump, mine run	$1.15@1.25
South Fork Miller Vein	1.50@1.60	Fairmont gas, slack	0.65@0.75
Clearfield (ordinary)	1.00@1.20	Fairmont lump, ordinary	0.85@0.95
Somerset (ordinary)	1.00@1.15	Fairmont run of mine	0.75@0.80
West Va. Freeport	0.85@0.95	Fairmont slack	0.45@0.75

Ocean charters from Philadelphia have been announced as follows:

Vessel	Nationality	To	Tons	Terms
Frankby	British	Barcelona	2618	
Hamborn	Dutch	Sagua	742	
Edwin R. Hunt		Porto Rico	1005	
Bertha L. Downes		Porto Rico	606	
Walter D. Noyes		New England		
Esrom	Danish	Havana	2040	
Hackness	British	Buenos Aires	2954	
Kariba	British	Buenos Aires	2350	
George Pyman	British	Barcelona	2350

Jata Mendi	Spanish	Barcelona	2746	$9.60
Llanover	British	Argentine	6500	
Tavian	British	So. America	2878	
Island	Danish	Havana	2040	
Eagle Wings		Charleston	1900	1.10
William Booth		Portsmouth	825	0.90
E. A. Allen		Summerside, P.E.I.	775	2.10
Orkla	Danish	Havana	1622	

Note—Steamers are indicated by **bold face** type.

The "Philadelphia News Bureau" reports that the collieries of the Reading and the Susquehanna coal companies operated three days last week.

OCEAN FREIGHTS

Steamers anxious for charters to Spanish ports. Substantial advance in rates to the Plate.

During the last week a number of steamers were chartered from Atlantic Range to picked ports on the west coast of Italy at $10.08. lay days to commence on vessel's arrival at or off port with 24c. per net register ton per day demurrage, and it may be possible to shade this rate slightly. As previously advised, steamers are particularly anxious to secure coal to Spanish ports, and will accept reasonable rates.

Plate rates have advanced very materially and $8.40 is now offered for steamers to take coal to Lower Plate ports. Grain freights from the Plate have declined considerably and the general impression is that the movement of this year's Plate grain has been about provided for.

The freight market is quotable as follows:

To	Rate	To	Rate
Havana	$2.00@2.25	Bermuda	$3.50@3.75
Cardenas or Sagua	**2.75**	Vera Cruz	3.50@3.75
Cienfuegos	2.75@3.00	Tampico	3.50@3.75
Port au Spain, Trinidad	3.50@3.75	Rio	**8.64**
St. Lucia	**3.50**	Santos*	**8.88**
St. Thomas	3.00@3.25	Montevideo	8.40@8.52
Barbados	3.50@3.75	Buenos Aires or La Plata	8.40@8.64
Kingston	2.75@3.00	Rosario	**9.12**
Curacao	**3.50**	West Coast of Italy	9.80@10.08
Santiago	2.50@3.00	Barcelona**	**9.00**
Guantanamo	2.50@3.00	Valparaiso or Callao	6.75@7.00
Demerara	5.00@5.85	Marseilles	**9.24**

Note—Rates noted in **bold face** type are only approximate.
* Consignees paying dockage dues. **Spanish dues for account.
W. W. Battie & Co.'s Coal Trade Freight Report.

NEW YORK

Bituminous stocks at Tide increasing and quick buyers can get cheap coal. Heavy export demand. Anthracite experiencing the full force of the midsummer dullness.

Bituminous—A slight improvement in demand, but not in prices, is noticeable. Large consumers are replenishing their bins and sales agents report better prospects. This together with a heavier call for export and bunker coal are the features of the soft-coal situation.

However, the general situation, as regards the New York market is quiet. Production in the Central Pennsylvania fields continues on about a half-time basis. Shipments to the Atlantic Seaboard are being continued as for the past several weeks while the accumulation at the local docks is increasing and quick buyers are able to pick up some good bargains in spot coals. Demurrage coal is not much in evidence and better reports are received from the line trade. Most shippers are depending largely on the Lake and Western business; increased demand is reported from these sources. Prices are weak. The call from New England has shown no signs of improvement.

Several big contracts were reported as being closed last week but the prices were not made public.

This month promises to be a record breaker in export demand. Additional inquiries are being received almost daily and there have been some inquiries with regard to gas coal for export. Companies with New York offices report an increased demand. Freight rates remain stiff. Some good sized cargoes have been sent to Spain and France and Italy is reported as having made several large purchases.

Current quotations continue as follows:

	South Amboy	Port Reading	St. George	Mine Price
Georges Creek Big Vein.	$3.30@3.40	$3.30@3.40	$3.30@3.40	$1.75@1.85

Steam........................		2.45@2.50	2.45@2.50	0.90@0.95
Western Maryland................		2.35@2.45	2.35@2.45	0.80@0.90

Anthracite—The call for anthracite coal shows no improvement, although this is the last week when dealers will be able to take advantage of the June discount. The midsummer "drag" is on and with the vacation season at hand, coalmen are practically taking a rest. Only those dealers who secured large contracts are able to work their entire force.

Some companies are working on a four-day basis while others are doing better. Individuals who thought that by cutting prices they would be able to move their stocks easily are beginning, apparently to realize the opposite. One reason advanced for this is that the retailers expect trouble in the coal fields next spring and are holding closer to the companies expecting that with a suspension of mining or a shortage of coal this winter their wants will be better looked after by the companies than by the individuals.

All prepared sizes are in plentiful supply. Nut coal is the longest; there is very little call for it at Tidewater and some companies are storing it Egg and stove are easier to move.

Current quotations are as follows:

	Lower Ports		Upper Ports	
	Circular	Individual	Circular	Individual
Broken................	$4.75		$4.80	
Egg..................	5.00	$4.80	5.05	$4.85

Note—Steamers are indicated by **bold face type,** all others being schooners.
[1] Bark. [2] Or Virginia [3]. West Coast.

HAMPTON ROADS

Shipments only fair. Heavy exports to Italy continue. Large tonnage being taken for bunkering.

Shipments of coal from tidewater have been fair although hardly as large as anticipated. During the week there have been days when some of the piers did but little dumping while at those where the major portion of the export coal was loaded there was heavy vessel tonnage in dock the entire week. The coastwise movement has gone to practically all of the New England ports with two large cargoes to the Pacific Coast for the U. S. Government.

While Pocahontas and New River run-of-mine have been the principal coals moving there has been some small amount of prepared gas coal shipped and some coke to Peru.

Although there has been no large number of bunker steamers calling a fair quantity of coal for this purpose has been shipped as nearly all vessels are taking above their normal requirements to save taking coal aboard in Europe.

The following vessels have cleared from Hampton Roads during the past two weeks:

Norfolk

Vessel	Destination	Tons
Anna[5]	Barbadoes	2500
Washington	Messina	6900
Sjostad[2]	Santiago	1525
Tabor[1]	Curacao	5500
Catalone	Annunziata	5385
Genova[3]	Catania	5500
Georgios	Civita Vecchia	5172
Wm. E. Burnham	St. Georges	1125
Venetia[4]	Dakar	4852
Woodard Abrahams	Casa Blanca	963
Comino	Callao	*1176
Banda	Amsterdam	4500
Enrichetta	Elba	5100

BALTIMORE

Export trade continues the leading feature. Domestic situation weak.

Interest centers on the export trade. In April it ran to 193,000 tons, the port record by more than 65,000 tons in any month; in May it reached 131,000 tons, while the first half of June saw such a heavy tonnage moved that the prospects for a total of from 250,000 to 300,000 tons do not seem exaggerated.

The domestic market, however, is very far from satisfactory. At the mines coal is still offering very cheap. Low-grade West Virginia coals are still offering at 75 to 85c. in many cases and ordinary Pennsylvania line fuels are to be had at 90 to 95 cents.

Charters for vessel loadings at Baltimore were announced as follows:

Vessel	Nationality	Tons	Destination	Rate
Mersario	British	2443	Montevideo	
Harflete	British	3021	Maddalena, Sicily	
Achlibster	British	2820	Barcelona	
Teviotdale	British	2528	West Coast Italy	
Luigi	Italian	2260	Civita Vecchia	
Scheria	Italian	1724	Palermo

[1] Bark.

During the week ending June 19 the export shipments from Baltimore totaled 89,929 tons.

LAKE MARKETS

PITTSBURGH

Slight signs of betterment, but operations remain at about 60% capacity and prices are low and unchanged. More export demand experienced by Connellsville operators.

Signs of betterment are beginning to appear in the Pittsburgh district. Demand from manufacturers has increased somewhat but as this is almost wholly against contracts, and the smaller operators that do not have large contracts are chiefly responsible for market prices, it does not help the market materially. The excellent crop prospects have revived hopes that the Lake movement will show considerable increases later. Export demand is becoming more a factor, particularly with Connellsville coke interests, who have a low mining scale and a very good grade of coal. The actual cost per net ton on cars is not over 40c. or 50c., and at going prices there is more money in shipping export coal than in turning it into coke. Mine operations in the Pittsburgh district proper remain at about 60% of capacity.

There is hardly any contract market, though $1.15 is the usual asking figure for mine-run to Apr. 1. Free coal ranges about as follows: Slack, 55@60c.; nut and slack, 90@95c.; nut, 95c.@$1; mine-run, $1@1.05; ¾-in., $1.10@1.15; 1¼-in., $1.20@1.25, per net ton at mine, Pittsburgh district.

BUFFALO

Slight improvement in bituminous, warranted by prospects of a stir in iron. Anthracite not selling as it should though this may cause a bigger rush than ever next winter. All mines running slow.

Bituminous—The trade shows some disposition to improve. There are not so many members who complain of no change which means a better business. Some of the iron districts are more active and are taking off the miners. Indications now are that there will be both car shortage and shortage of men as soon as the demand for fuel is good again.

The Lake trade is doing a little better. One shipper, who diverts his coal this way when the Lakes demand drops off, has sold all he cares to here and is now concentrating on the Lake trade. Others look to the large and growing export coal trade and if the home demand increases the circle will be complete, even though the improvement is not large. There is not much business from Canada and sales to that trade show no improvement. If the war should suddenly stop there might be an early return to business.

Bituminous prices remain on the former basis of $2.70 for best Pittsburgh lump, $2.55 for three-quarter, $2.45 for mine-run and $2.25 for slack, with Allegheny Valley sizes 25c. less.

Anthracite—There is no stir in the anthracite trade. The demand is very light. The mid-summer lull has come in mid-spring this year and it is not likely to change till there is cool weather to remind the consumers of winter. Some of the retailers are buying moderately, to get their supply at bottom prices, but they are not selling as fast as they are buying. Coal will slowly accumulate with them till the fall trade sets in.

The anthracite mines are running much slower than they commonly do at this time of the year. The amount shipped by Lake from this port for the week was 145,000 tons, a large showing for the time of the year and the state of the trade.

TORONTO

Demand continues light and supplies plentiful.

The demand in all lines continues light with no immediate prospects of any improvement. Dealers are stocked up for several months ahead and well provided against any scarcity which might result from labor troubles. Quotations for best grades are unchanged as follows: Retail anthracite, egg, stove and nut, $7.50; grate, $7.25; pea, $6. Bituminous, steam, $5.25; screenings, $4.25 to $4.50; domestic lump, $6; cannel, $6. Wholesale f.o.b. cars, $3.56; screenings, $2.90.

COLUMBUS

Steam business quiet though some better buying is reported in domestic circles. Lake trade increasing. Small sizes the only grades in demand.

The trade has been rather quiet during the past week. There is no increased buying of steam grades and that department remains dull. Some increase in the stocking movement is reported and a larger tonnage has been moving to the bins of the retailers. On the whole the tone of the market is not very good, although some operators profess to have a hopeful view of the future.

Buying for stocking purposes is increasing in every locality. This is especially true of the better grades such as Pocahontas and West Virginia splints. Some of the jobbers are selling quite a little Hocking lump for that purpose. The stocking movement is expected to be more marked after the coming convention of the Michigan-Ohio, Indiana Coal Association at Cedar Point, Ohio.

Lake business is increasing since the eastern Ohio field has resumed operations. Reports from the Northwest show that the docks are still very much congested and that interior buying is limited.

One of the best features of the trade is the strong market for the small sizes. Nut, pea and slack both from Ohio and West Virginia is in good demand as the production is rather limited. The same is true of coarse slack.

Prices in the Ohio fields are:

	Hocking Valley	Pomeroy	Kanawha
Rescreened lump	$1.45	$1.50	.....
Inch and a quarter	1.35	1.35	$1.30
Three-quarter inch	1.25	1.30	1.25
Nut	1.15	1.25	1.15
Mine-run	1.05	1.10	1.05
Nut, pea and slack	0.70	0.75	0.65
Coarse slack	0.60	0.70	0.55

Mines have been working at about the following percentage of full capacity:

	Week Ended					Week Ended			
District	May 29	June 5	June 12	June 19	District	May 29	June 5	June 12	June 19
Hocking	30	30	25	25	Cambridge	35	35	35	30
Jackson	20	20	20	15	Masillon	35	35	40	35
Pomeroy	45	50	50	50	Eastern O.	15	25	30	45
Crooksville	35	35	30	30					
					Average	26	33	33	33

TOLEDO

Smokeless demand fairly good with small supplies at Toledo. Lake trade continues light. Indications that railroads may soon contract.

Some boats are being loaded in the Lake trade and quite a lot of coal is being shipped to the local docks but there is nothing that resembles a real market as compared with other seasons. It is probable that the movement will be heavier later on but this continues uncertain. This same condiiton prevails at Sandusky.

Smokeless coal is in fair demand and the prepared sizes are short. The production of the Hocking, Pomeroy and Cambridge districts is light and there will probably be very little improvement until the threshing season opens. West Virginia production is not specially heavy and will probably not be much improved until the Lake movement is larger. The Pittsburgh No. 8 district will have a better movement when the railroads begin placing orders; occasional inquiries are being received which would indicate that a number of the roads may soon place contracts. Prices are not being very closely maintained here save in a few lines.

CINCINNATI

General sluggishness prevails in all departments of the market. Industrial inactivity is apparently the principal cause.

The market still fails to show anything like the usual activity of the early summer. The several factors responsible for this remain unchanged, making it apparent that no relief can be looked for soon. The relative inactivity in manufacturing the tendency of the retailers to hold off stocking and the fact that production can be pushed to a high figure at any time, have combined to keep the market extraordinarily weak and dull. All varieties of rail and river coal are in plentiful supply on this market.

LOUISVILLE

Preparations for threshing is causing some activity but the market continues quiet.

Nothing has occurred in the Kentucky field during the past week or ten days to give the market any better tone, except that threshing will soon begin and there is some preparation for that. Some of the flouring mills of the state are making preparations to run when the new wheat comes on the market and are laying in coal.

Contracts are proving hard to make at this time, the industrial concerns preferring to take their chances on the open market. The Northern markets are not absorbing sufficient coal to relieve the pressure as usual. Cold weather has hurt the trade some due to its effect on the crops. Prices range in neighborhood of the following: Block, $1.50; round nut, $1.20; steam run-of-mines, $1. These are top prices, the regular June schedule, and there is not much shading or cutting, it is stated, because there is no market to buy even at low prices.

CLEVELAND

The local market is still lower and the downward tendency has not been checked. Pocahontas alone shows strength.

Slack prices are from 5 to 7c. lower than a week ago. Offerings of coal are made at almost any price to obtain an order. Pittsburgh fine coal sold Monday at $1.45 and Ohio No.

8 at the same price; these are nominal figures and 2c. less was accepted by some. The supply received here is not in excess of needs, but the offerings of operators were so heavy prices could not be maintained.

Coarse coals are barely holding their own at last week's quotations. The Lake trade is not taking enough coal to hold the market firm; Lake shipments are off 40% with no improvement in sight. May shipments from Duluth-Superior docks were smaller than in April and 2000 cars less than May of the last two years. Other ports report business on the same basis.

Pocahontas is up a little and egg and lump sizes are held fairly firm at quotation. Mine-run is about the same, but not as high proportionately.

Quotations for shipment to jobbers are as follows:

	Pocahontas	Youghiogheny	Bergholz	Fairmont	Ohio No. 8
Lump..........	$3.45	......	......	....	......
Lump, ¾ in.....	.....	$2.15	$1.95	$1.85@1.90	$1.8 @1.90
Egg...........	3.45	......	......	....	......
Mine run.......	2.65	2.05@2.10	1.80	1.80	1.75@1.85
Slack..........	......	1.45	1.45	1.45	1. 5

COKE

CONNELLSVILLE

Coke market disappointing through not reflecting improvement in steel. Occasional sales at lower than current quotations.. Production and shipments make fresh high record for the year.

Coke operators are disappointed that the market does not show more life, when conditions in the steel trade are improving so steadily. The inquiry that recently appeared for second-half is largely hanging fire, partly perhaps because operators are trying to obtain $1.75 minimum with a sliding scale instead of $1.75 flat. A contract recently made, but which is just now heard of by the trade, involved about 7000 tons a month over the second-half, for Wheeling, at a price said to be under $1.70. A sale over the next two months has just been made at $1.50, and both these transactions are at lower figures than were supposed to represent the market.

Production and shipments of Connellsville coke have increased 65% since December without any real stiffening in prices and a labor shortage is threatened if much further increase in operations is required. The Frick Co. has blown in several hundred ovens in the past fortnight, when it could have increased its output by putting some of its operating plants on a six-day schedule, because it wished to get and hold the men against future requirements.

We quote furnace coke at $1.50@1.60 for spot and nearby shipment and $1.75 for second-half, and foundry coke at $2@2.40 for prompt and $2.20@2.50 for contract, per net ton at ovens.

The "Courier" reports production in the Connellsville and lower Connellsville region in the week ended June 12 at 334,514 tons, an increase of 19,617 tons, and shipments at 332,595 tons, an increase of 11,454 tons, both being new high records for the year.

Buffalo—There is report of improvement and even of better prices, but it is too early to say that it is a fact. Some stir in the iron trade is also regarded as a certainty, either now or to take place right away. One condition that is against an advance in either coke or iron is that there is no corresponding increase of activity in bituminous coal, which is waiting for a stir of that sort. Quotations remain on the basis of $4.25 for best 72-hr. Connellsville foundry and $3.25 for stock coke.

Chicago—The coke market is stronger. The tendency of prices for gas house coke is higher, and sales have increased. Domestic sizes also show betterment, but no change has occurred in the demand for foundry grades. Prices are as follows: Byproduct, $4.65@4.85; Connellsville, $4.85@5; Wise County, $4.75; gas coke, $3.75@4.90; furnace, $4.75.

MIDDLE WESTERN

GENERAL REVIEW

Market generally stationary with more activity in domestic sizes. Screenings easier. Smokeless coal still gaining strength. Anthracite demand improved.

Surface conditions remain unchanged from a week ago, though the same feeling of optimism still prevails. Operators are not so eager to contract their output at low prices, and in several instances advances have been announced to take effect on July 1. It is true not a large volume of business is moving, but undoubtedly the sentiment has changed.

Storage buying, which is from two to three months late, has now begun, and although not of great consequence as yet is bound to have a healthy effect in July. Some buying is noted on the part of country dealers to replenish stocks. The Northwest seems to be taking heavier tonnages than any other section at the present time. It is expected that higher prices will prevail for Indiana and Illinois coals next month, owing to the small tonnage thus far stocked and increasing inquiries received for quotations covering deliveries in the immediate future.

CHICAGO

Improved running time at southern Illinois mines. Prices to advance on July 1. Situation in Indiana grades less favorable.

It is understood that the southern Illinois operators have had improved running time, some of the mines making six days last week; they are shipping more domestic sizes, particularly to the Northwest and very little is moving at less than $1.35, while it is announced that $1.50 will be the list price on July 1. It is also understood that No. 1 nut will be held for $1.50, and No. 2 at $1.35 on the first of next month. The demand for steam sizes is only fair and screenings are a trifle easier, but are holding at about 85c.

The movement of lump coal from Sullivan County is very slow, but in spite of this, screenings have declined on an average of 10c. per ton although it is thought that this is only temporary, and prices will shortly be on a higher level. Steam buying is slowing up and shippers are having difficulty in renewing contracts. The demand for coarse steam sizes has fallen off, and price cutting is noted. Some Indiana coal has been sacrificed in the Chicago market during the past week at a concession of 5c. to 10c. per ton, and the Indiana outlook seems to be generally less promising than in Illinois. Very little domestic sizes are moving from Sullivan County.

The market for Clinton and Knox County coals is dull, the demand for all sizes being quiet, but prices are well maintained.

Spot sales of Pennsylvania smokeless lump and egg have been made as low as 30c. per ton under list and plenty of mine-run has been sold at $1 per ton but operators expect higher priced orders next month.

A considerable tonnage of eastern Kentucky coal has been forwarded on consignment, and prices are still variable.

The demand for all-rail Hocking is light, but the operators continue to keep free coal off the market.

There is increased buying in anthracite, and further West it is reported that concessions have been made in order to market chestnut.

Quotations in the Chicago market are as follows:

	Williamson and Franklin Co.	Springfield	Sullivan	Clinton	Knox and Greene Cos.

ST. LOUIS

Beginning of the threshing season has a stimulating effect on the market. Prices a trifle stiffer.

The opening of the threshing season in the South and preparations for its opening in the West, North and Northwest is putting more life into the market than it has manifested this spring. The threshing outfits do not use a great quantity of coal but it is enough to stimulate the market to a perceptible extent.

The increased demand has stiffened prices a little. Threshing will not be on in the North for a couple of weeks but orders have already been placed. The result has been an advance of upwards of 10c. on the lump and egg sizes that the threshers use. Screenings are a little stronger than last week. Some natural improvement is expected around the first of July and there are indications that such improvement is about to set in.

	Wilm. & Frnk. Co.	Sparta	Mt. Olive	Standard

INDIANAPOLIS

Screenings the only grade in demand. Not much improvement anticipated until the crop movement starts.

Mine operations continue at about the minimum, as usual in summer. There is plenty of coal on the open market, except screenings, which are in rather short supply and for which the demand is relatively good. However, contracts for screenings are difficult to make, owing to the experiences of last year, when buyers in the open market could get them almost at their own price; whether they will have this luck again is purely speculative.

The trade runs along at about the same level week by week and no change is expected until grain begins to move. Usually about that time cars become scarce, but operators do not anticipate much of a shortage the coming fall. The industrial demand does not seem to improve noticeably, nor does it fall back. Mine-run sells at $1 to $1.20 and screenings at 80c. to 90c. Indiana has promise of good crops of wheat and oats, particularly the latter, which will break the state record.

KANSAS CITY

The retail coal market in Kansas City has shown no signs of life for the week. The demand and the prices have both remained at the very lowest. The wholesale market seems to have settled into a routine of an even demand and supply. Prices remain unchanged and business confined almost entirely to the steam grades.

PRODUCTION AND TRANSPORTATION STATISTICS

BITUMINOUS COAL MOVEMENT

The following is a summary of the movement of coal and coke over 13 principal railroads during April and the first four months of the last two years, in short tons:

	April		4 Months	
Anthracite	1914	1915	1914	1915
Baltimore & Ohio[1]	129,220	125,682	536,762	433,130

FOREIGN MARKETS

GREAT BRITAIN

June 11—Owing to new restrictions imposed on the export of coal, and the consequent refusal of licences in many cases, the market has for the moment a downward tendency. The output of coal is, however, diminishing. Quotations are approximately as follows:

Best Welsh steam	Nominal	Best Monmouthshires	$7.20@7.44
Best seconds	Nominal	Seconds	6.96@7.20
Seconds	$7.20@7.80	Best Cardiff smalls	5.16@5.40
Best dry coals	7.20@7.80	Cargo smalls	4.44@4.56

The prices for Cardiff coals are f.o.b. Cardiff, Penarth or Barry, while those for Monmouthshire descriptions are f.o.b. Newport, both net, exclusive of wharfage.

Freights—Chartering is very limited in extent owing to export difficulties and rates, while "patchy," are distinctly lower. Rates are approximately as follows:

Gibraltar	$3.84	Naples	$5.40	St. Vincent	$4.80
Marseilles	4.83	Alexandria	5.04	Rio de Janeiro	6.36
Algiers	3.86	Port Said	4.92	Monte Video	5.76
Genoa	5.28	Las Palmas	4.32	River Plate	6.00

Exports—British exports for May and the first five months of the past three years were as follows:

	May			Five Months		
To	1913	1914	1915	1913	1914	1915
Russia	650,197	533,074	10,735	1,442,564	1,304,074	16,139

Note—The figures in the above table do not include Admiralty and certain other shipments.

Coal Contracts Pending

The purpose of this department is to diffuse accurate information of prospective purchases and prices with a view to affording equal opportunity to all, promoting market stability and inculcating sound business principles in the coal trade.

For the official advertisements of bids wanted see the Contracts-to-Be-Let Section on Page 12.

+Indicates contracts regarding which official information has been received.

Recast

In the following table we give a list of all old contracts coming up for consideration during the ensuing week. The table gives our contract number, the name of the purchaser, city, tonnage and page on which the detail notice appeared:

No.	Purchaser	City	State	Tonnage	Page
459	Am. Cocoa Butter Co.	Chicago	Ill.	200b[1]	627
545	Ballard & Ballard	Louisville	Ky.	15,000a	708

Supplemental Notes

Under this heading additional or supplemental information regarding old contracts appears, together with the page number of the original notice.

+**No. 624—Providence, R. I.**—Only three bids were received on this contract (p. 795), which provides for furnishing the local Board of Education with about 8500 tons of anthracite coal, and all of these were rejected and the business readvertised. The new bids were opened at noon, June 16, but no advices as to the results have as yet been received. Address School Committee, 32 Summer St., Providence, R. I.

No. 726—New York—Bids on this contract (pp. 916, 955, 1004, 1084 and 1088), calling for 2700 tons of egg coal for the fireboats on the North River and in New York harbor, were reopened on Monday of this week. The bidders and prices were: John F. Schmadeke, $6.16 per ton, total bid, $16,632; William Farrell & Sons, $6.17 per ton, total bid, $16,659. Address Fire Comr. Robert Adamson, Municipal Building, New York City.

+**No. 801—Henderson, Ky.**—Bids are being advertised for on this contract (p. 1005), which provides for furnishing the local Municipal Electric Light Station with about 9000 tons of slack coal. The old contract was supplied by the People's mines at this place. Address Supt. L. P. Hite, Municipal Electric Light Station, Henderson, Ky.

+**No. 819—Austin, Tex.**—The requirements on this contract (p. 1048), which provides for furnishing the state charitable institutions with coal, are as follows: 1660 tons of domestic lump or shaker screen coal; 2400 tons nut coal or nut and slack coal mixed; 100 tons of McAlester lump; 420 tons of lignite. The bids may be accepted on any or all of these tonnages. Bids are to cover the cost of delivery to the institutions switch for freight yards, as designated. Deliveries are to be as required. Address State Pur. Agt., Geo. Leavy, Austin, Tex.

New Business

+**905—Logan, Ohio**—Sealed bids will be received by the local Board of Education until July 2, for furnishing approximately 400 tons of lump coal to be delivered at the various school houses during the ensuing school year. Bidders should specify what kind of fuel they propose furnishing. Address Clk. Herbert R. Harrington, Logan Village School District, Logan, Ohio.

+**No. 906—Eufaula, Ala.**—The Water and Light Department at this place will be in the market during July or August for approximately 2500 tons of Pratt, mine-run coal. The usual price is about $2.85 delivered in the bins. Address Supt. J. L. Kenny, City of Eufaula Water and Light Dept., Eufaula, Ala.

+**No. 907—Juniata, Penn.**—The local School Board received bids until 6 p.m. June 21, for furnishing the various schools with approximately 300 tons of coal, deliveries to be completed by July 20. Analysis are to accompany all bids. Address Secy. J. W. Fleck, Juniata School Board, Juniata, Penn.

+**No. 908—Chicago, Ill.**—The West Chicago Park Commissioners received bids until 4 p.m., June 22, for furnishing and delivering coal during the fiscal year beginning July 1, approximately as follows: 1835 tons of Pocahontas mine-run; 70 tons of Pocahontas lump; 34 tons of anthracite nut; 438 tons anthracite range; 5500 tons Indiana or Illinois screenings. A certified check must accompany all bids. Proposals are to be submitted on forms which may be obtained on application. Address West Chicago Park Commissioners, Union Park, Chicago, Ill.

+**No. 909—McConnelsville, Ohio**—Sealed proposals were received by the Board of Education, until 9 a.m., June 19, for furnishing the coal requirements of the various buildings of Malta Township. Quotations should be made f.o.b. cars, and bids will also be received for hauling coal to the schools. The successful bidder will be required to give a bond of $100. Address Clk. W. S. Conners, Bd. of Edu. Malta Township, McConnelsville, Ohio.

+**No. 910—Lincoln, Neb.**—The Local Light and Water Department will be in the market some time during the latter part of July for approximately 9600 tons of Pittsburgh (Kansas) mill and nut coal. The business is done on a competitive basis and the customary price is $3.70 per ton. Address James Tyler, City Water & Light Department, Lincoln, Neb.

+**No. 911—Cherokee, Iowa**—The Independent School District at this place will receive bids until 7:30 p.m., July 1, for furnishing approximately 300 tons of Illinois Standard lump coal. Deliveries are to be completed on or before Aug. 15. Address Secy. William Shardlow, Independent School District of Cherokee, Cherokee, Iowa.

No. 912—Freeport, Ill.—Bids will be received until noon, June 30, for furnishing approximately 160 tons of Pocahontas coal for the local Court House and Jail. Address H. C. Althoff, Board of Supervisors, Stephenson County, Freeport, Ill.

+**No. 913—Canonsburg, Penn.**—The local School Board received bids until June 21, for furnishing the fuel requirements for the ensuing year. Address Secy. George H. Challener, Canonsburg, Penn.

+**No. 914—Fort Dodge, Iowa**—Bids will be received until 7 p.m., July 6, for furnishing the several schools of the local district with coal for a period of one year. Bids should be submitted on lump, mine-run, and steam coal, and an analysis of the coal must accompany all bids. Address Acting Secy. H. M. Pratt, Bd. of Edu., Fort Dodge, Iowa.

+**No. 915—Oakville, Ont.**—Sealed bids were received until June 21 for furnishing a year's supply of coal for the county buildings of Halton. Address Chn. County Bldg. Com. A. S. Forster, Oakville, Ont.

+**No. 916—Salem, N. J.**—Sealed bids were received until 7 p.m., June 21, for furnishing the Salem City Water Works at Quinton, with coal during the ensuing year. Proposals should cover both the coal and cost of delivery at the station. Address Supt. Charles W. Dunn, City of Salem, Room 6, Dunn Bldg., Salem, N. J.

+No. 917—Springfield, Ohio—The Board of Education at this place will be in the market some time during July or August for approximately 2500 tons of Hocking lump coal which is usually bought at $3.07½ per ton. The call for bids is advertised and the business usually let to local dealers. Address Clk. Wm. H. Holmes, Bd. of Edu., Springfield, Ohio.

No. 918—Kansas City, Mo.—The Kansas City Municipal Water and Light Department will be in the market some time during July or August for approximately 500 tons of lump coal and 20,000 tons of mine-run. The business is usually closed on Cherokee coal for which $3.45 is paid for lump and $2.25 for mine-run. The contract is let on competitive bids. The lump coal is used at the City Hall and must be delivered in wagons while the mine-run is for use at the water and light plant and quotations should be made f.o.b. the plant. Address Pur. Agt. C. W. Lovelace, Kansas Municipal Water and Light Dept., Kansas City, Mo.

+No. 919—Pontiac, Mich.—The Board of Education received bids until 2 p.m., June 22, for supplying approximately 1000 tons of West Virginia threequarter lump coal and 100 tons of anthracite stove and egg sizes. Bids were to include cost of delivery at the schoolhouses during the year ending June 1. A certified check for $100 must accompany all bids. Address Secy. Elmer R. Webster, Bd. of Edu., Pontiac, Mich.

+No. 920—Lincoln, Neb.—Sealed proposals were received at the Board of Commissioners of the state institutions until 10 a.m., June 19, to furnish the fuel requirements of the various institutions for the fiscal year beginning July 1. About 4500 tons will be required at the Hospital for the Insane at Hastings, and 5450 tons at the State Penitentiary. Altogether about 32,000 tons of steam coal will be needed. All bids are required to be accompanied by a certified check for 5% of the amount bid. Address Secy. Leo Matthews, Bd. of Comrs. of State Institutions, Lincoln, Neb.

+No. 921—Rensselaer, Ind.—The county commissioners of Jasper County will receive bids until July 6 for furnishing 400 tons of coal. Address Audr. J. P. Hammond, County Comr. Rensselaer, Ind.

+No. 922—New Orleans, La.—The School Board of this place will receive bids about July 1 for furnishing approximately 2000 tons of both anthracite and bituminous coal for delivery to the 88 school buildings of New Orleans. The gross consideration is between $12,000 and $15,000. Specifications may be obtained on application. Address Purchasing Agent, New Orleans School Board, City Hall Bldg., New Orleans, La.

+No. 923—Lansing, Mich.—Bids will be received by the Michigan School for the Blind until noon, June 29, for furnishing approximately 1500 tons of three-quarter steam lump coal Bids should include cost of delivery in school bins. Address Supt. C. E. Holmes, Board of Control, Michigan School for the Blind, Lansing, Mich.

No. 924—Indianapolis, Ind.—Bids will be received until July 2 for furnishing the school buildings and the poor of Center Township with coal during the ensuing fiscal year. All bids should include cost of delivery. The bids are wanted on Sullivan No. 6 or Linton No. 4, and on Pocahontas third vein mine-run. Address Trustee, John W. Castor, 311 Saks Bldg., Indianapolis, Ind.

No. 925—Ionia, Mich.—The Board of Supervisors of Ionia County received bids until noon, June 21, for furnishing 200 tons of Pocahontas lump coal. One-half the deliveries are to be made immediately, and the balance during the winter or spring. Address Building Committee, Board of Supervisors, Ionia County, Ionia, Mich.

+No. 926—Detroit, Mich.—The Police Department of this place received bids until 11 a.m., June 22, for furnishing approximately 700 tons of anthracite, stove and egg coal, and 100 tons of chestnut, deliveries to be made during the year beginning July 1. Bids should include cost of delivery in the bins at the various police stations, and the successful bidder will be required to furnish a bond guaranteeing the faithful performance of the contract. Address Secy. of Police, Geo. A. Walters, Detroit, Mich.

+No. 927—Shelbyville, Ind.—The county commissioners of Shelby County will receive bids until July 6 for supplying the court house, jail, orphans home, and county farm with coal during the ensuing year. Address Audr. F. W. Flagel, County Comr., Shelbyville, Ind.

+No. 928—Quincy, Ill.—The Board of Education at this place usually contracts some time during July or August for their annual requirements of coal. The price on the current contract was $2.84 for 4-in. screened lump. The call for bids is not advertised in the papers. Address Business Mgr. Clyde L. Sears, Bd. of Edu., Quincy, Ill.

+No. 929—New Orleans, La. — Sealed proposals were received until June 21, for furnishing the Charity Hospital at this place with its annual requirements of bituminous and anthracite coal. Address Hon. Chas. A. Farwell, Charity Hospital, New Orleans, La.

+No. 930—East St. Louis, Ill.—The Board of Education here contracts either in July or August for their annual requirements of coal amounting to, approximately, 2800 tons. Bituminous lump is ordinarily used, and the current contract is being filled at $1.59¾ per ton. The call for bids is advertised. Address, Board of Education, East St. Louis, Ill.

+No. 931—Sharon, Penn.—The School Board at this place will receive bids until noon, July 6, for furnishing the local schools with coal for the school year beginning Sept. 8. Three-quarter inch coal is required. Address Secy. W. Whitehead, Sharon School Bd., Sharon, Penn.

+No. 932—Memphis, Tenn.—The Board of Education here contracts some time during the summer for their annual fuel requirements amounting to about 2500 tons of pea, slack, nut and mine-run coal. The usual price is about $2.50 per ton. The call for bids is advertised. Address E. S. Conser, Bd. of Edu., 876 Union Ave., Memphis, Tenn.

No. 933—New York—We are informed on reliable authority that the Board of Education will soon request bids for furnishing and delivering 18,000 tons of Buckwheat No. 3, and 6000 tons of semibituminous coal. Official announcement has not yet been made, or any specific dates set for opening the bids. Address Supt. of Supplies, Patrick E. Jones, Bd. of Edu., Park Ave. and 59th St., New York, N. Y.

+No. 934—Worcester, Mass.—Sealed bids will be received until noon, June 28, for furnishing and delivering 3879 tons of anthracite, and 7779 tons of bituminous to various public buildings. A satisfactory bond will be required guaranteeing the faithful performance of the contract. Address Supt. of Public Buildings, Geo. C. Halcott, Room 35, City Hall, Worcester, Mass.

+No. 935—New York, N. Y.—The Department of Docks and Ferries will receive bids until noon, July 2, for furnishing 2000 tons of Buckwheat No. 2. For previous purchases by this department see contract No. 49, p. 149, and No. 373, p. 567. Complete details may be had on application. Address Comr. of Docks, R. A. C. Smith, Pier A, Foot of Battery Place, North River, New York, N. Y.

+No. 936—Springfield, Mass.—Sealed bids will be received until 10 a.m., June 30, for furnishing the House of Correction, Court House, Hall of Records and Training School with coal as follows: Bituminous, 1200 tons; anthracite egg, 80 tons; nut, 10 tons; stove, 30 tons. Address Asst. Clk. Chas. M. Calhoun, Bd. of County Comrs., Springfield, Mass.

+No. 937—Amsterdam, N. Y.—Bids will be received until 1 p.m., June 28, for furnishing the local Public Schools with approximately 900 tons of anthracite grate, egg, stove, chestnut, and pea coal. Bids are to cover cost of delivery in the bins of the several school buildings. Address Clk. Leslie L. Bebb, Bd. of Edu., High School Bldg., Amsterdam, N. Y.

+No. 938—Owensboro, Ky.—Bids will be received until June 28 for furnishing the local public schools with 18,000 bu. of lump or mine-run coal. Deliveries are to be made at Bon Harbor or by rail. Address George H. Cox, Owensboro Public Schools, Owensboro, Ky.

No. 939—Richmond, Mo.—The Missouri Gas & Electric Service Co. at this place is requesting bids for furnishing their fuel requirements during the fiscal year beginning July 1. Clean coal for steaming purposes is required, and bids should include cost of delivery in the bin at the power house. The successful bidder will be required to furnish a bond guaranteeing the fulfillment of the contract. Address Missouri Gas & Electric Service Co., Richmond, Mo.

+No. 940—Rochester, Penn.—The school district of this place will receive proposals until July 1 for furnishing and delivering 4000 bu. of Pittsburgh lump coal to the various school buildings during the ensuing year. Address Secy. Geo. H. Karcher, Rochester School District, Rochester, Penn.

+No. 941—Helena, Mont.—The Board of Education at this place will receive bids until June 26 for furnishing their coal requirements during the ensuing year, which are approximately as follows: Mine-run, 600 tons; No. 2 nut, 600 tons; lump, 50 tons; also an alternative bid on 500 tons of forkings Deliveries are to be made at the various school buildings during the year beginning Sept. 1. Address Clk. Thos. E. Goodwin, Bd. of Trustees, Room 40, Bailey Block, Helena, Mont.

No. 942—Lafayette, La.—Bids will be received by the Southwestern Louisiana Industrial Institute, until July 1, for furnishing 300 tons of coal. Bidders should submit official B.t.u. tests of their coal. Address Southwestern Industrial Institute, Lafayette, La.

Contracts Awarded

+No. 208—St. Peter, Minn.—This contract (p. 400), which provides for furnishing the local City Government with between 1200 and 1400 tons of coal has been awarded to the **Purity Coal Co.** on range coal at $1.30 per ton f.o.b. cars at the mine. Address Supt. F. N. Wilson, St. Peter Electric Light & Water Works, St. Peter, Minn.

+No. 360—Chicago, Ill.—This contract (p. 566), which provides for furnishing the Acme Steel Goods Co. with its supply during the ensuing year, has been awarded to the **Paradise Coal Co.,** of Du Quoin, Ill., on its 2-in. screenings. Address Pur. Agt. H. H. Onstott, Acme Steel Goods Co., 2834 Archer Ave., Chicago, Ill.

No. 511—Dayton, Ohio—This contract (pp. 665, 748), which provides for furnishing the National Soldiers' Home with about 23,000 tons of coal during the ensuing year has been awarded to **E. A. Cole & Co.** at $2.49 per ton for West Virginia lump. Address Treas. W. H. Ortt, National Military Home, Dayton, Ohio.

+No. 585—Washington, D. C.—The anthracite awards on this contract (pp. 749, 875, 1084), which provides for furnishing coal for various of the Government buildings in the District of Columbia, were as follows:

Butler Building	J. Edward Chapman	Furnace	P. & R.	$5.69
Medical Museum	J. Maury Dove Co.	Furnace	P. & R.	5.73
Lemon Building	J. Maury Dove Co.	Egg	P. & R.	6.29
Ford's Theatre	Commercial Coal Co.	Stove	Mammoth	6.57
Department of Justice	J. Maury Dove Co.	Egg	P. & R.	6.30
Civil Service Commission	J. Maury Dove Co.	Egg	P. & R.	6.35
Geological Survey	L. Edward Chapman	Furnace	P. & R.	5.94
Weather Bureau	J. Edward Chapman	Furnace	P. & R.	5.68
Department of Commerce	J. Edward Chapman	Furnace	P. & R.	5.68
Coast & Geodetic Survey	J. Edward Chapman	Furnace	P. & R.	5.60
Bureau of Fisheries	J. Maury Dove Co.	Egg	P. & R.	6.15
Executive Mansions	W. H. Marlow	Furnace	P. & R.	5.95
Executive Office Building	W. W. Griffith	Furnace	P. & R.	5.95
Greenhouses	J. Maury Dove Co.	Furnace	P. & R.	5.68
Washington Monument	J. Maury Dove Co.	Egg	P. & R.	6.08
Navy Annex	J. Edward Chapman	Furnace	P. & R.	5.73
Soldier's Home	J. Edward Chapman	Stove	P. & R.	6.74
Soldier's Home	J. Edward Chapman	Furnace	P. & R.	5.84
Botanic Garden's	Commercial Coal Co.	Furnace	Mammoth	5.64

No awards have as yet been made for the Hospital for the Insane and for the Government Printing Office. Address Acting Secy. of the Treasury Byron R. Newton, General Supply Committee, Washington, D. C.

+No. 617—Kalamazoo, Mich.—This contract (p. 795), which provides for furnishing the local city government with its coal supply during the ensuing year, has been awarded to **Samuel Buurma,** on nut, pea and slack coal, at $2.44 per ton for deliveries made before Aug. 1, and $2.54 per ton thereafter. The cost includes shoveling in the bin. Address City Clk., C. L. Miller, Kalamazoo, Mich.

+No. 659 — Philadelphia, Penn. — This contract (pp. 836, 1050), which provides for furnishing the Lighthouse Department with coal has had further awards made in addition to those listed last week as follows: **Pennsylvania Coal & Coke Corp.,** bituminous, $2.60 per ton for delivery at Wilmington, Del.; **Charles Warner Co.,** for same delivery anthracite stove $5.90 and nut $6.05. Address Inspector T. J. Rout, 4th Lighthouse Dist., Philadelphia, Penn.

+No. 802—Boston, Mass.—This contract (pp. 1005, 1085), which provides for furnishing the Bay State Street Ry. with about 155,000 tons of steam coal has been awarded to the **Consolidation Coal Co.,** on 95,000 tons of Jenner coal for delivery at Quincy, Lynn, and Chelsea, Mass., and Newport and Portsmouth, R. I. and the balance, about 61,000 tons to the New England Coal & Coke Co. on New River coal to be delivered at Beverly, Mass., and Mystic Wharf, Boston. Address A. P. Emmons, Bay State Ry. Co., 84 State St., Boston, Mass.

+No. 803—Jackson, Mich.—This contract (p. 1005), which provides for furnishing the local Board of Education with about 1700 tons of coal has been awarded to **Collins, Hahn & Dalziel** on the following basis delivered in bin: Anthracite $7.75; Pocahontas lump $5; West Virginia splint 1½ in. lump $2.80; Hocking nut $2.80. This compares with last year's prices as follows: Anthracite $7.75; Pocahontas $5; West Virginia splint $3. Address Supt. Bldg., J. F. Forward, Bd. of Edu. 331 Ten Eyck St., Jackson, Mich.

+No. 808—Philadelphia, Penn.—This contract (p. 1006), which provides for furnishing the Bureau of Charities with coal during July, August and September, was awarded as follows: **Dexter & Carpenter,** 1730 tons of gas coal at $2.68; **Charles S. Sale,** 125 tons of pea coal at $3.95; **Rogers-Corr Coal Co.,** 300 tons of stove coal at $5.89. Address Dir. Herman Loeb, Bureau of Charities, Room 312, City Hall, Philadelphia, Penn.

Contract Notes

Winona, Minn.—The **Western Elevator Co.** was awarded the contract for supplying coal to all the schools next season.

Philadelphia, Penn.—Geo. B. Newton Coal Co., received the award for delivery of white ash buckwheat to the Eastern Penitentiary, at $2.76, and the Rogers-Corr Coal Co., have received from Girard College the award of 9100 tons of the same kind and size of coal at $2.30.

Stearns, Ky.—Thirty cars of block coal, consigned to Toledo, Ohio, for the Lake trade, have been shipped from here by the Stearns Co. This is the first consignment of a contract calling for ninety cars to be delivered in a short time. The mines are operating to capacity on this order.

Boston, Mass.—One of the curious features of the local bunkering situation is that most of the transatlantic steamers lately arriving have been coaled to capacity on the other side and their requirements here are little or nothing; and this in spite of the high prices that prevail over there.

Boston, Mass.—A power-house contract placed this week was divided between New River and a Somerset County (Penn.) coal, the larger tonnage to the latter. This is not exceptional on this particular contract but is shows that Pennsylvania coals are active competitors in this market.

+St. Paul, Minn.—The city purchasing committee last week opened bids on 17,000 tons of various grades of coal. The People's Coal & Ice Company was the lowest bidder on one grade of coal at $4.50 a ton. There were twelve bidders. The bids have been tabulated and referred to the various departments for advice.

Columbus, Ohio—The Hatton-Brown Coal Co., has secured a contract to furnish 100,000 tons of coal to the Atlantic Coast line. The supply of fuel for the company is secured from a number of operators, but the Hatton-Brown Co., was lucky in getting the largest tonnage of any operator on the Norfolk & Western.

Hudson, Mass.—The Mottoquottoc Worsted Co. at this place consumes about 1000 tons of bituminous coal per annum. It seldom contracts but makes its purchases in 300-ton lots which is the amount they have storage capacity for. Deliveries are made by rail. Address J. H. Hancock, Mottoquottoc Worsted Co., Cherry St., Hudson, Mass.

Philadelphia, Penn.—The condition of the anthracite market was clearly reflected at the recent convention of the Pennsylvania Retail Coal Men's Association, at Wilmington, Del., where, before over 900 retail men, President Tattersal, in his speech of acceptance of office, stated that no coal dealer could be considered a good business man who purchased coal at any figure in excess of the April circular.

Birmingham—Contracts totaling at least 1,000,000 tons of steam coal have been closed here recently. The Seaboard Airline contracted for 335,000 tons distributed as follows: Sloss Sheffield Steel & Iron Co., 200,000 tons for the Florida Division; The Alabama Co., 120,000 tons for the Birmingham Division and the Pratt Consolidated Coal Co., 15,000 tons for the Montgomery Division. Among other contracts was one for the Southern Ry. amounting to 500,000 tons. No announcement has yet been made as to the division of this order.

Foreign

Philadelphia, Penn.—Bituminous interests here have recently been in touch with Walter L. Webb who it is understood is representing various Italian interests in the purchase of coal and pig iron. It is stated on good authority that he expects to place orders for coal amounting to not less than 100,000 tons.

Insular Possessions—An American consular officer in one of the insular possessions reports that a business man in his district desires to purchase 500 tons of the best grade of American steaming coal. Shipments are to be by sailing vessel, the consignee to pay all expenses of the vessel while in the foreign port, as well as the costs of unloading. Prices should be made c.i.f. destination. The man states that he requires one shipment per annum of 500 tons of coal.

Amsterdam, Netherland—Press reports are to the effect that the American Consul at this place states that the Nederland Steamship Co., plying between Amsterdam and the Dutch East Indies proposes sending some of these vessels to American ports for coal. It is stated that the coal will be used both on its own steamers and those of the Holland-American line, which formerly coaled at Rotterdam. Holland imports from Germany and Great Britain have become too uncertain to be relied upon.

The Advantage of Replacing Mules with Jeffrey Storage Battery Locomotives—

The Jeffrey Storage Battery Locomotive is rapidly replacing men and mules where grades are not too steep or hauls excessively long.

The above photograph shows a 6-ton storage battery locomotive hauling coal from room in the mines of the Vandalia Coal Mining Co., Terre Haute, Indiana. Excellent results are being obtained from these locomotives while in other mines Jeffrey Storage Battery Locomotives as light as 2½ tons are rapidly replacing other means of transportation. The above installation is well described in Bulletin 122-12. It will gladly be sent on request.

Here are a few of the advantages which Jeffrey Storage Battery Locomotives offer you:

The locomotive is self-contained and will go anywhere that track is laid. Cost of feeder, trolley wires, bonding and flexible cables is eliminated.

One man is all that is necessary to operate the locomotive and handle the cars.

A 3 to 5-ton locomotive will replace 3 or 4 mules with their attendant upkeep.

Have you a copy of Bulletin 117-12 describing the complete line of Jeffrey Mine Locomotives? Sent free on request.

You Get the Edison Electric Safety Mine Lamp

COMPLETELY APPROVED

Bureau of Mines
First Approval under Schedule 6A for Safety and for Practicability in General Service.

American Museum of Safety
Awarded the Rathenau Gold Medal for "the best device or process in the electrical industry for safeguarding industrial life and health."

Exposition of Safety
Awarded the Grand Prize at the First International Exposition of Safety and Sanitation.

Mines using Storage Battery Locomotives are familiar with the Ruggedness, Light Weight and Strength of the Edison Storage Battery and its remarkably long life under the severest operating conditions. The same type of Nickel and Iron Elements with Non-acid (Potash) Electrolyte is used in the Edison Mine Lamp Batteries.

⚒ ⚒ ⚒ ⚒ ⚒ ⚒ ⚒ ⚒

Some Exclusive Advantages of the Edison Portable Mine Lamp

1. Non-rusting, light, strong and durable monel-metal carrying case. 2. Battery elements in unbreakable steel containers. 3. Batteries may be left standing idle charged or discharged, may be charged at any time irrespective of conditions of charge remaining, may be short circuited, overcharged indefinitely and charged in a reverse direction without injury. 4. There is no acid to injure person or clothing. 5. No corrosive or obnoxious fumes given off when charging.

Next Year?

This year the ball bearings in your locomotives are O. K.

But *next year*—what about it? Do you know what is going to happen next year or the year after that to the bearings which run so well now?

There is no way of predicting from the looks of the bearings. The only basis of prediction is the service of Hess-Bright ball bearings in the past, on mine locomotives.

Severe try-outs show that HESS-BRIGHTS stand up under this duty.

Why not get the bearings which will *permanently* eliminate ball bearing troubles—HESS-BRIGHT.

HESS-BRIGHTS cost more, but your builder equips with them if you specify "H.B."

The Hess-Bright-Mfg. Co.
Front St. and Erie Ave.
Philadelphia, Pa.

HESS-BRIGHT

BALL BEARINGS
Patented

Non-Cloggable Burner

Take it point for point—Finish—Material—Workmanship—and you will find the Baldwin compares more than favorably with any of the other carbide lamps.

Now add to the above, the advantages of our Non-Cloggable Burner—Rigid Removable Reflector—Never Failing Sparker Lighter, and most important of all—The Patented Automatic Water-Feed and you have a combination which puts the

BALDWIN

THE MINER'S LIGHTING BUG

as far ahead of other carbide lamps, as they are ahead of oil lamps and candles.

Our New Brass Burner cannot break and it will not clog. Air is drawn in through the slots—this air prevents carbonization. The burner screws on; use a screw driver, coin or miners' check to take the burner off or put on a new one just as you would an ordinary screw. No white-lead, grease or soap needed to make a gas-tight joint.

The Reflector is Removable, the burner holds it on. It is strongly braced at the back by a stamped brass reinforcing shell—this holds it as rigidly as though soldered, still it's easily taken off. This gives the user the choice of other sizes and shapes and also makes it possible to renew the reflector should it become damaged.

The Sparker Lighter works every time; as the burner rides close to the surface of the reflector, the spark from the lighter can come directly in contact with the escaping gas and ignite it—there is never a miss.

The Patented Automatic Water-Feed regulates the water supply—there is never any fussing with valves or regulating screws as the feed is unerring in its action and economical in the use of carbide. A single movement of the raking wire once or twice during the life of a charge is all the attention this lamp requires.

Every Baldwin is sold with the positive money-back guarantee, unless the lamp is perfectly satisfactory, we do not expect you to pay for it.

Rigid Removable Reflector

Try This Lamp for 30 Days—at Our Expense

Send me a Baldwin Carbide Lamp for 30 days' use—at the end of the trial period, I will either send you $1.00 or return the lamp.

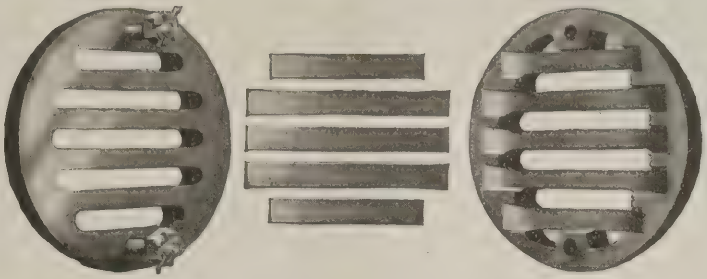
Your Air Compressor is just as Efficient as its valves—And No More

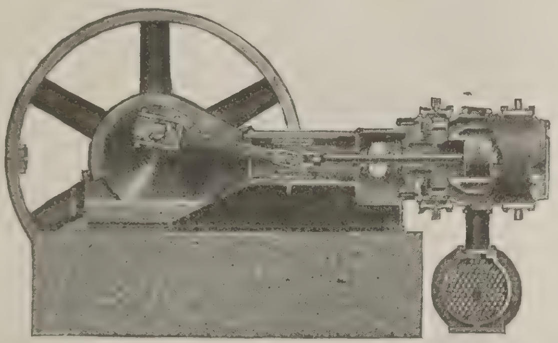


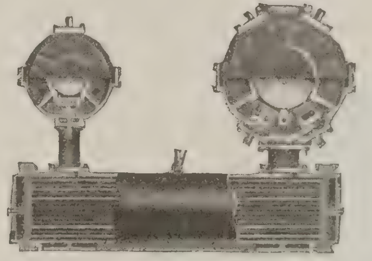
Any competent builder can supply a good compressor frame and running gear if he embodies in his costs the right design, materials and workmanship. You will find in our class PF-2 Compressor more good features than are combined in any other compressor. **But** the one feature that places this compressor in a class by itself is the

LAIDLAW FEATHER VALVE

(Patented)

"The Solution of Air Compressor Valve Troubles"





In this valve is combined **Simplicity, Lightness, Flexibility, Quietness, Durability** and **Unequalled Efficiency.**

The valves are thin strips of non-corrosive steel alloy. These very flexible strips seat tightly on ground face-slotted seats, and in opening, flex against slotted guards curved to permit proper openings for the passage of air; the ends remaining in contact with the seat at all times.

The valve closes by **contact,** not by **impact.** The only automatic valve whose **area** through valve **lift** is equal to **area** through **seat.**

Bulletin L-530-73 tells the story. **Write for it.**

The "Little Tugger" Hoist can be furnished for operation by steam or air.

The "Little Tugger" Hoist Is Now Automatically Oiled

This hoist for hoisting and handling work in and about the mine already possessed many advantageous features not to be found in any similar tool.

In spite of this leadership the Company's engineers sought for still further inprovement. The result was the design of an automatic lubrication system, simple, economical and independent of attention, insuring long life to wearing parts and a decided elimination of friction.

The "Little Tugger" is compact, easily set up and operated and will soon pay for itself in the saving which it effects handling drills, mountings, timbers and material in the mine.

More Belting Service Less Expense

PRIOR to thirty-six years ago leather belting set the standards of price for proper belt service.

At that time Gandy Stitched Cotton Duck Belting was first made.

Today, after thirty-six years of experience with Gandy Belt, thousands of users testify that Gandy does the work equally as well at about 1/3 the cost of leather belting, and at much less than rubber belting.

"Gandy" has set a new standard for belt expense. Do you know what Gandy can do in **your** plant? If not 36 years of success warrants your investigating.

Samples and name of nearest distributor on request.

Milwaukee **Wisconsin**

THE selection and proper application of the right lubricant will almost entirely eliminate depreciation in any machinery. In mine car equipment, there is a tremendous opportunity for saving in this direction—the scrap heap of wheels and axles, most of them burned or worn out through poor lubrication, is a familiar sight.

The services of our experts are at the command of mining companies without charge.

"119" KEYSTONE GREASE

for mine car wheels

Number 119 *Keystone Grease* is not affected by heat or cold. It won't thin out in hot weather nor thicken in cold but remains the same the year around and affords perfect lubrication every day.

One filling of the wheels will last from *three* to *six* months,—often longer.

We'll make it easy for you to try it. Write us.

Applying No. 119 *Keystone Grease with a Keystone Grease Gun, which is supplied with the first order. The gun is made from heavy seamless steel tubing, with a tapered drawn brass nozzle, which can be cut to fit any opening.*

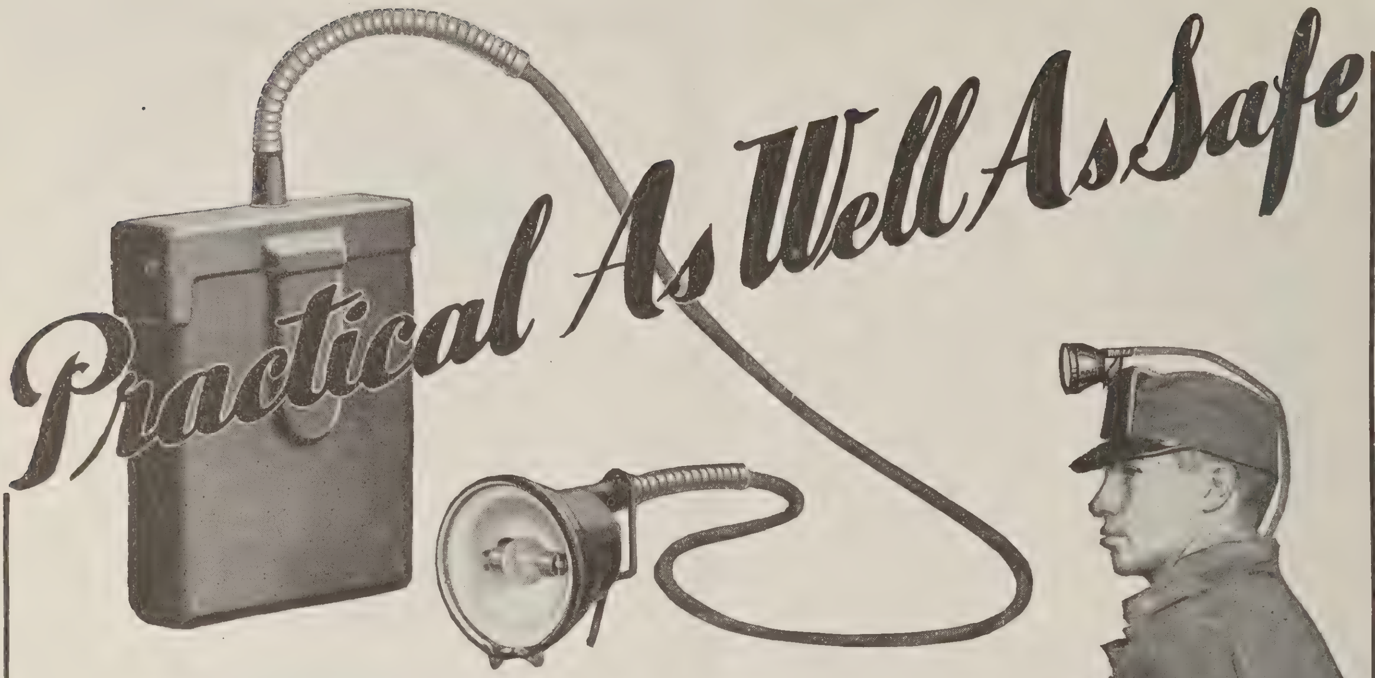
202



THE G-E MINERS' LAMP is practical as well as safe. It is light in weight, convenient in size and efficient.

The small, compact, sturdy cap lamp weighs less than four ounces and throws an evenly-diffused light through a solid angle of 130 degrees.

The strongly-constructed cable is amply long to avoid constricting the wearer's movements. It is protected against sharp bends at either end by flexible armor.

The battery is a non-spillable, lead plate storage type weighing about three pounds and of a size convenient for attaching to the miner's belt.

The construction of the outfit makes it absolutely safe for use in the presence of explosive gases. Even if the lamp is shattered as the result of an accident, to the wearer, there is no afterglow to ignite the most inflammable gas.

Ask our nearest office about this Lamp.

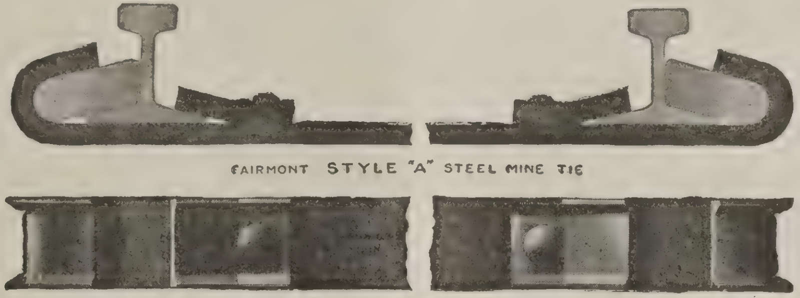
FAIRMONT
COAL MINE EQUIPMENTS

Fairmont Steel Mine Ties



FAIRMONT STYLE "A" STEEL MINE TIE

Mr. Jenkins, the Superintendent of the Marshall Coal Company, is an enthusiastic user of Fairmont Steel Mine Ties. We recently received the following statement from him:

"The ties were in sulphur water for more than two years and so far as I can see it has caused no material damage.

"I find in using these ties in room work that it saves considerable time and money for the reason that we have no trouble in keeping cars on the track."

Mr. Jenkins also speaks of the time saved in laying track and the greater facility in working low coal.

Why not ask us to put you in touch with some other users for direct inquiry, if you are interested in realizing large savings on your track equipment? Write.

FAIRMONT
Double Acting Electric Driven Force Pumps

Borderland, W. Va.,
March 7, 1914.

Fairmont Mining Machinery Company,
Fairmont, W. Va.
Gentlemen:

We have yours of the 5th and beg to advise that we have several of your mine pumps in operation, and so far we have been to no expense with these pumps with the exception of a few leather crimps and an extra set of valves.

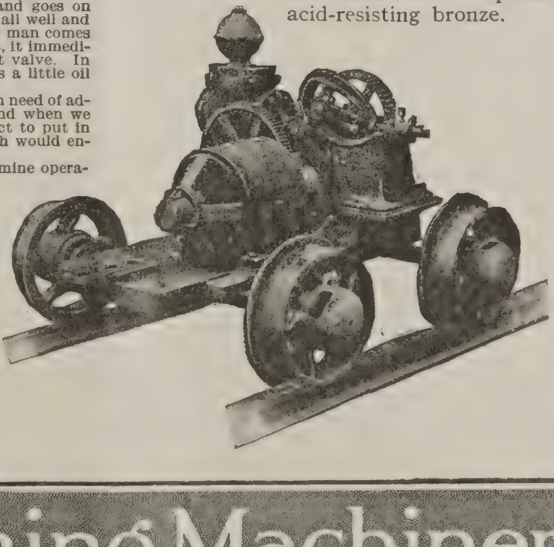
These pumps are started early in the morning, to pump out the various places, and as one man looks after all of the pumps in that mine he throws in his switch and goes on about his business. If the sump is pumped dry all well and good. The pump may continue to run until the man comes back, and, if, in the meantime any water appears, it immediately pumps it out as soon as it covers the foot valve. In other words, about all the attention they get is a little oil or grease every now and then on the gears.

I wish to state further that as soon as we are in need of additional pumps we expect to use this pattern, and when we have to renew some of our old pumps we expect to put in this style in case you make it belt driven, which would enable us to use the motors we have on hand.

We cheerfully recommend this pump to any mine operation needing this style or size.

Yours very truly,
BORDERLAND COAL COMPANY,
(signed) L. E. Armentrout,
Manager.

Read the letter opposite. It's typical of what every user has to say concerning these remarkable portable pumps that can be taken to any part of the mine and left to operate without an attendant. The cylinders and valves are made from a special acid-resisting bronze.



Write for interesting catalog giving full particulars of the complete line of Fairmont Coal Mine Equipments.

CONTRACTS TO BE LET

Bids received until June 29, 1915.

Coal Supply

Lansing, Mich.

The Michigan School for the Blind will receive bids until noon, June 29th, for supplying the School with 1500 tons more or less of ¾ Steam Lump Coal, weighed on the School scales and delivered in school bins, deliveries to be made so the school will not be hampered. Bidders must state whether the coal they propose to furnish is mined in Michigan and give the minimum B.t.u. value. Bids must be addressed to the Board of Control, Michigan School for the Blind, placed in sealed envelope and addressed to

SUPERINTENDENT C. E. HOLMES,
Michigan School for the Blind, Lansing, Mich.

⁂

Bids received until July 13, 1915.

To Coal Bidders

Ionia, Mich.

Bidders are invited to present sealed proposals to furnish supply of coal for one year ending June 30, 1916, to the Ionia State Hospital, Ionia, Michigan, and mark same "Proposals for Coal" and address to Dr. R. H. Haskell, Medical Superintendent, Ionia, Michigan, where they will be opened by the Board of Trustees, Tuesday, July 13, 1915. The coal is to be bituminous nut and slack (size of screen used must be specified), and furnished in such quantities as the Medical Superintendent may from time to time direct; two thousand five hundred tons in all, more or less. Bids must give name and place of mines from which coal is to be furnished and be accompanied by a chemical analysis and show the number of British Thermal Units guaranteed and the percentage of ash. The price is to be for the coal delivered f.o.b. cars on the Ionia State Hospital unloading tracks and shipments made in flat bottom cars. The right is reserved to reject any or all bids.

The bidder to whom award is made will be required to furnish surety company bond in the sum of One Thousand Dollars for the faithful performance of all the provisions of the contract.

The "Repeat" Order
Its Meaning is Engineering

Directly the "repeat order" is no indication of the service that **you** can expect from any machine as **specific** in its work as a hoist.

But the "repeat" order does show that some other purchaser, with conditions equally as specific as your own, got a machine in the **first place** that proved so good as to make him buy a second—and so on—from the same builder.

It shows you—when one VULCAN Hoist after another is bought by the same concern—that Vulcan engineers can **grasp** and **interpret** specific conditions exactly.

Isn't there significance for you in the fact that most VULCAN Hoists are "repeat" orders

Vulcan Iron Works

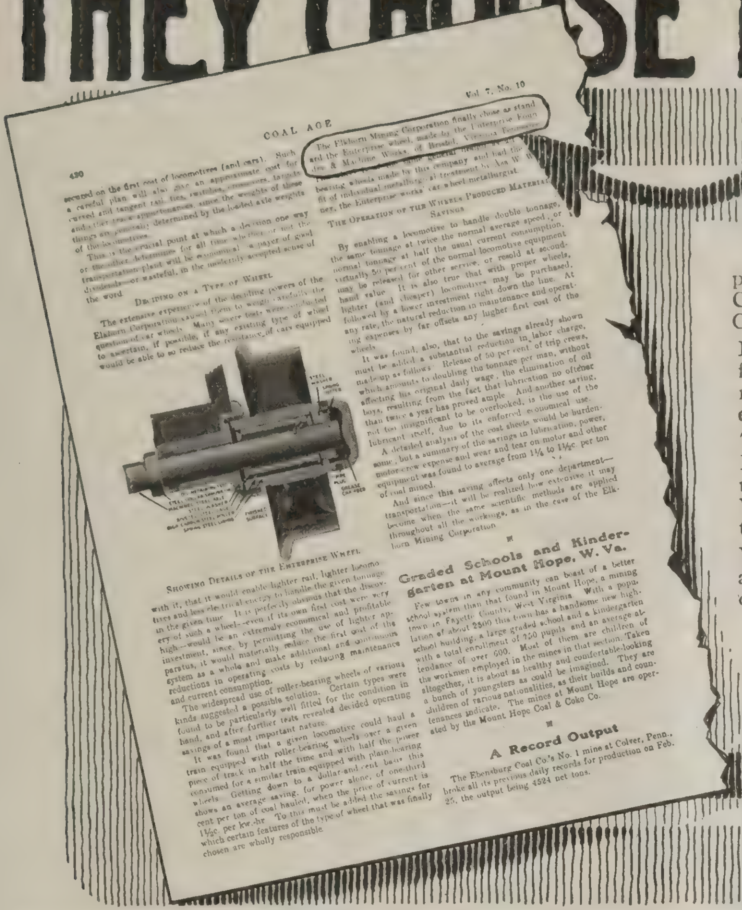
THE MAKE-IT-PAY DEPT. OF COAL AGE

THEY CHOOSE ENTERPRISE *Chilled Car Wheels*



490 COAL AGE Vol. 7, No. 10

secured on the first cost of locomotives (and cars). Such a careful plan will also give an approximate cost for curved and tangent rail, ties, switches, crossovers, targets and other track appurtenances, since the weights of these things are generally determined by the loaded axle weights of the locomotives.

This is the crucial point at which a decision one way or the other determines for all time whether or not the transportation plant will be economical—a payer of good dividends—or wasteful, in the modernly accepted sense of the word.

DECIDING ON A TYPE OF WHEEL

The extensive experience of the deciding powers of the Elkhorn Corporation caused them to weigh carefully the question of car wheels. Many severe tests were conducted to ascertain, if possible, if any existing type of wheel would be able to so reduce the resistance of cars equipped with it, that it would enable lighter rail, lighter locomotives and less electrical energy to handle the given tonnage in the given time. It is perfectly obvious that the discovery of such a wheel—even if its own first cost were very high—would be an extremely economical and profitable investment, since, by permitting the use of lighter apparatus, it would materially reduce the first cost of the system as a whole and make additional and continuous reductions in operating costs by reducing maintenance and current consumption.

The widespread use of roller-bearing wheels of various kinds suggested a possible solution. Certain types were found to be particularly well fitted for the condition in hand, and after further tests revealed decided operating savings of a most important nature.

It was found that a given locomotive could haul a train equipped with roller-bearing wheels over a given piece of track in half the time and with half the power consumed for a similar train equipped with plain-bearing wheels. Getting down to a dollar-and-cent basis this shows an average saving, for power alone, of one-third cent per ton of coal hauled, when the price of current is 1½c. per kw.-hr. To this must be added the savings for which certain features of the type of wheel that was finally chosen are wholly responsible.

SHOWING DETAILS OF THE ENTERPRISE WHEEL

The Elkhorn Mining Corporation finally chose as standard the Enterprise wheel, made by the Enterprise Foundry & Machine Works, of Bristol, Virginia-Tennessee [illegible] general [illegible] bearing wheels made by this company and had the [illegible] fit of individual metallurgical treatment by Asa W. W [illegible] ney, the Enterprise works' car wheel metallurgist.

THE OPERATION OF THE WHEELS PRODUCED MATERIAL SAVINGS

By enabling a locomotive to handle double tonnage, the same tonnage at twice the normal average speed, or normal tonnage at half the usual current consumption, virtually 50 per cent. of the normal locomotive equipment may be released for other service, or resold at second-hand value. It is also true that with proper wheels, lighter (and cheaper) locomotives may be purchased, followed by a lower investment right down the line. At any rate, the natural reduction in maintenance and operating expenses by far offsets any higher first cost of the wheels.

It was found, also, that to the savings already shown must be added a substantial reduction in labor charge, made up as follows: Release of 50 per cent. of trip crews, which amounts to doubling the tonnage per man, without affecting his original daily wage; the elimination of oil boys, resulting from the fact that lubrication no oftener than twice a year has proved ample. And another saving, not too insignificant to be overlooked, is the use of the lubricant itself, due to its enforced economical use.

A detailed analysis of the cost sheets would be burdensome; but a summary of the savings in lubrication, power, motor-crew expense and wear and tear on motor and other equipment was found to average from 1¼ to 1½c. per ton of coal mined.

And since this saving affects only one department—transportation—it will be realized how extensive it may become when the same scientific methods are applied throughout all the workings, as in the case of the Elkhorn Mining Corporation.

Graded Schools and Kindergarten at Mount Hope, W. Va.

Few towns in any community can boast of a better school system than that found in Mount Hope, a mining town in Fayette County, West Virginia. With a population of about 2500 this town has a handsome new high-school building, a large graded school and a kindergarten with a total enrollment of 750 pupils and an average attendance of over 600. Most of them are children of the workmen employed in the mines in that section. Taken altogether, it is about as healthy and comfortable-looking a bunch of youngsters as could be imagined. They are children of various nationalities, as their builds and countenances indicate. The mines at Mount Hope are operated by the Mount Hope Coal & Coke Co.

A Record Output

The Ebensburg Coal Co.'s No. 1 mine at Colver, Penn., broke all its previous daily records for production on Feb. 25, the output being 4524 net tons.

THIS is a page from a story in "Coal Age" on the wonderful plant and equipment of the Elkhorn Mining Corporation of Fleming, Haymond, Hemphill, Garrett and Wayland, Kentucky.

Exhaustive tests were conducted with every form of equipment, before final choice was made in order to ascertain which was most efficient.

The exclusive choice of Enterprise Roller Bearing Wheels—every one of which is made under the personal supervision of Asa W. Whitney—is most significant, because it shows that ENTERPRISE **proved** their superiority.

We will gladly demonstrate their superiority at your mine, and send full information, without the slightest obligation.

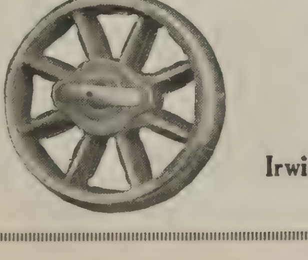
A Different Wheel

Here's a wheel that's easy to oil—that holds a large amount of oil—that is easily put on and taken off.

A wheel that gives real service.

Irwin Mine Car Wheel

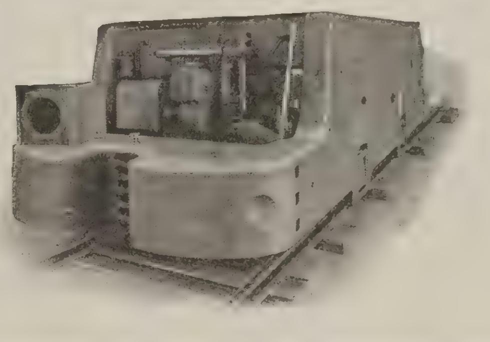


In this wheel the oil hole is located on center, the oil chamber is large. Features that mean ease of oiling and long time running on one oiling. The linch pin is always accessible—No trouble to remove wheel.

This wheel means smaller maintenance costs—better service. GET DETAILS TODAY.

Irwin Foundry & Mine Car Co.
Irwin, Pa.

You Can't Figure Otherwise



when you get right down to comparative costs—actual users' data, than that **Whitcomb Gasoline Mine Motors** are the cheapest mine haulage—ranging from 10 to 50% lower in operating costs than any other systems. And this reduction is perfectly logical when you consider the low initial cost of this **unit** system requiring no outside power plants, bonded rails, wiring, charging stations, etc.

Whitcomb Gasoline Mine Motors

It only remains to demonstrate their dependability and their safe and entirely satisfactory operation. We can refer to any one of over 200 mines for the evidence that will be conclusive in this respect.

Let's get together and work out the **facts.** No obligation whatever no matter how large a saving we can positively show you.

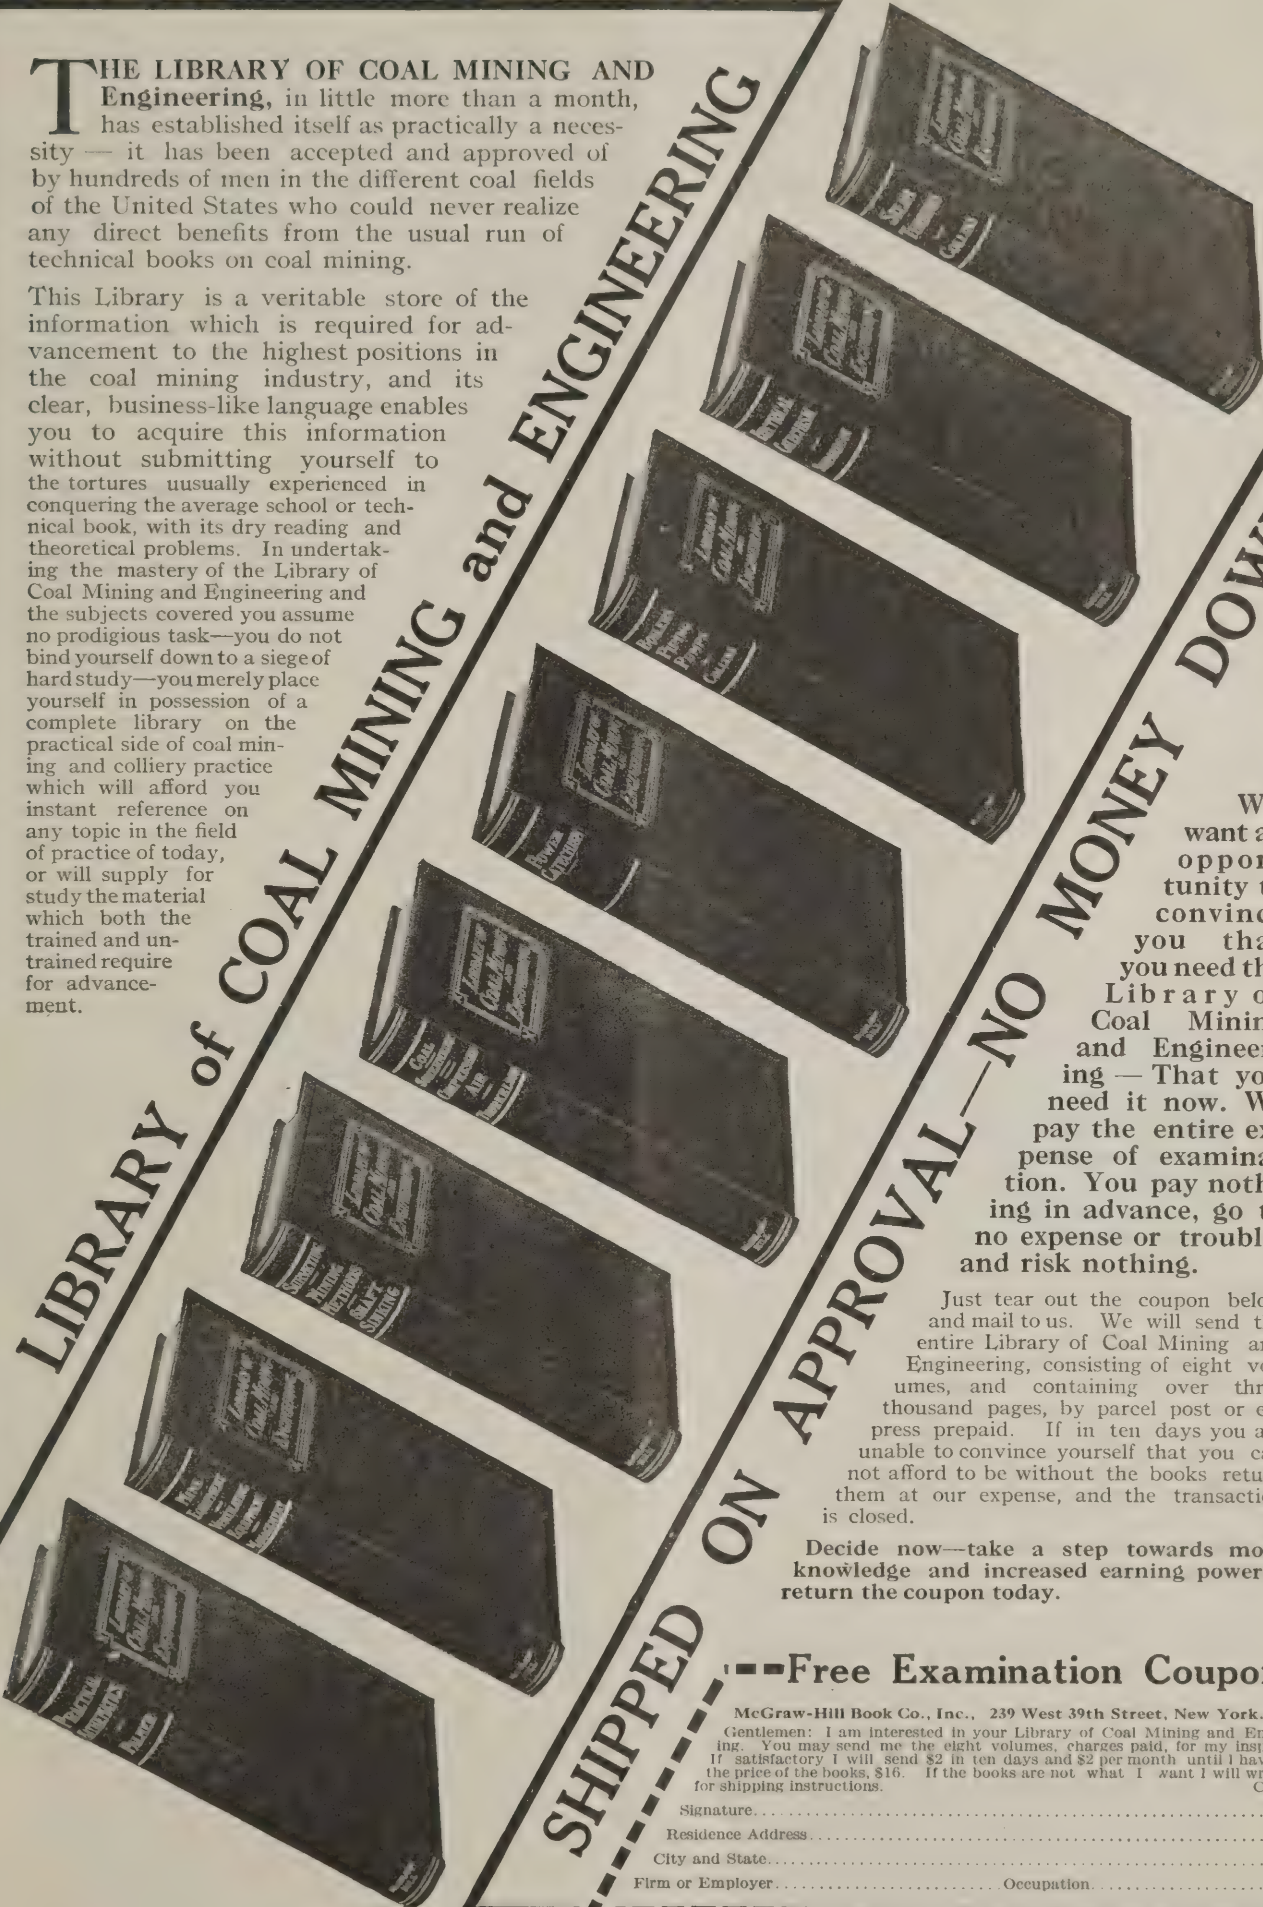
THE LIBRARY OF COAL MINING AND Engineering, in little more than a month, has established itself as practically a necessity — it has been accepted and approved of by hundreds of men in the different coal fields of the United States who could never realize any direct benefits from the usual run of technical books on coal mining.

This Library is a veritable store of the information which is required for advancement to the highest positions in the coal mining industry, and its clear, business-like language enables you to acquire this information without submitting yourself to the tortures uusually experienced in conquering the average school or technical book, with its dry reading and theoretical problems. In undertaking the mastery of the Library of Coal Mining and Engineering and the subjects covered you assume no prodigious task—you do not bind yourself down to a siege of hard study—you merely place yourself in possession of a complete library on the practical side of coal mining and colliery practice which will afford you instant reference on any topic in the field of practice of today, or will supply for study the material which both the trained and untrained require for advancement.

LIBRARY of COAL MINING and ENGINEERING



SHIPPED ON APPROVAL—NO MONEY DOWN

We want an opportunity to convince you that you need the Library of Coal Mining and Engineering — That you need it now. We pay the entire expense of examination. You pay nothing in advance, go to no expense or trouble, and risk nothing.

Just tear out the coupon below and mail to us. We will send the entire Library of Coal Mining and Engineering, consisting of eight volumes, and containing over three thousand pages, by parcel post or express prepaid. If in ten days you are unable to convince yourself that you can not afford to be without the books return them at our expense, and the transaction is closed.

Decide now—take a step towards more knowledge and increased earning power—return the coupon today.

Free Examination Coupon

Perforated Steel Screen Plates

For Coal and Coke, Crushed Stone, Phosphate Rock, Gravel, Sand, etc.

¶ Cylindrical Screen sections rolled to diameter lap or butt joints, and fastened with clips, bolted or riveted—segments for Taper Screens rolled to diameter with bolt holes in margins.

¶ Flat screen plates of any dimensions to 10x20 feet to one inch thick for heavy work.

¶ Standard sizes of Round, Oblong and Square holes—special sizes made to suit.

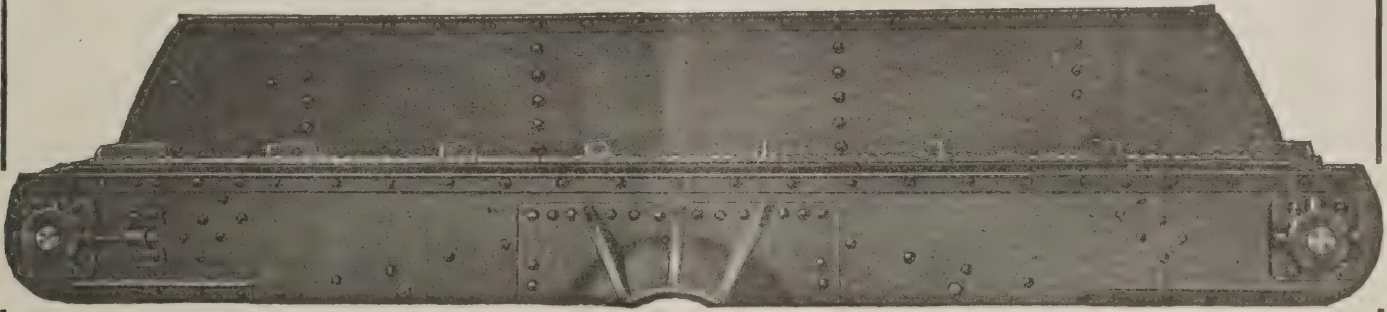
¶ Manganese Bronze or Monel Metal screens for acidulated or sulphurous mine waters.

OUR sizes are standard centers (distance apart) but we can give you closer or wider spacing if required—in other words *you get what you want.*

The screens are made with care, exact to details of size, thickness and dimensions—in point of material and workmanship the best of their kind.

Please send detail specifications with your order or inquiry.

THE HARRINGTON & KING PERFORATING CO.
628 North Union Ave., CHICACO, ILL.
New York Office: 114 Liberty Street



Our **Superior Loader** carries coal full length of this long reversible conveyer, gives perfectly loaded product, is durable and has large capacity.

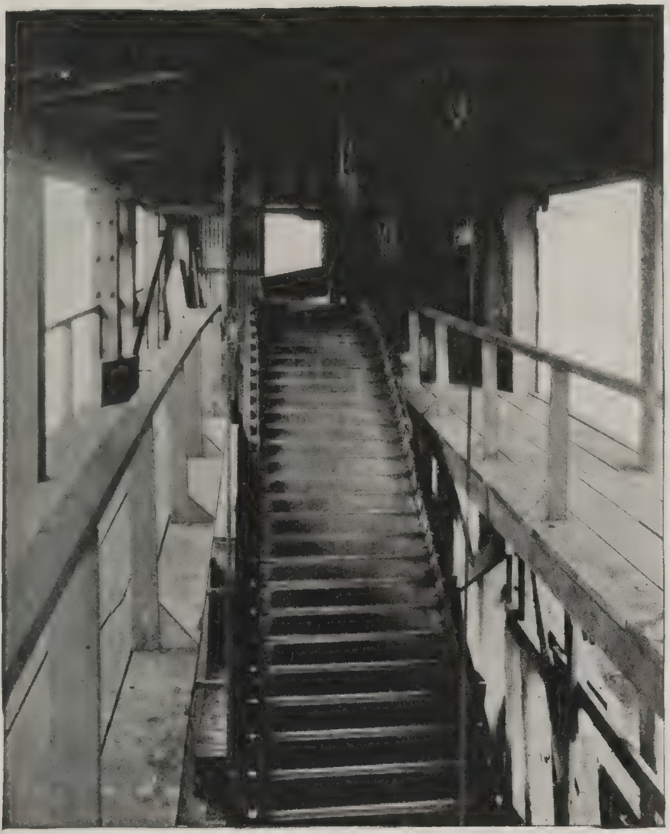
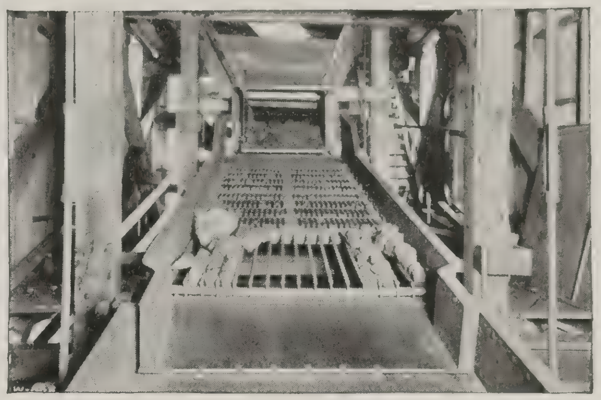
TIPPLE EQUIPMENT

A Complete Outfit for the
Howard Collieries Co.
Chattaroy, W. Va.





COAL is dumped to a hopper, from which the plate feeder (shown above) delivers it to the balanced shakers—the upper one shown above and the lower one below.

Smaller sizes are chuted to cars, while lump goes to the loading boom (shown on the left) for delivery to the car without breakage. The boom is long, because clearance had to be maintained for passage of a locomotive on the track beneath.

A Typical Webster Outfit—
Typically Successful.

and Preparation of Coal at the Mine

Price—Dollars
Every Time You
Miss an Issue

The Link-Belt Long Wall Coal Conveyor

A highly efficient machine for conveying coal cut by the Long Wall Cutters to the cars

The Conveyor shown herewith was built for the Penna. Coal Co. It is 250 feet long and driven by a 7½ H.P. Back Geared Motor to give a speed of about 80 feet per minute. Driving mechanism can be placed on either side to suit conditions. The conveyor, which consists of a heavy H class chain, is mounted on a steel frame and trough—the trough being made into 16′ interchangeable sections and bolted together. This permits a section to be added whenever required as the coal is mined through the tunnel and makes it easy to transfer conveyor from one working face to another.

These machines are doing excellent work, and we recommend them wherever they can be used. They are strongly built for the work expected of them. Price and full particulars on request.

Let us work with you in planning your new Tipple, screening plant, picking table, or any other improvement you contemplate making. We make no charge for advice, layouts or estimates.
